

Figure S1. Dose dependent effects of Dexamethasone on hMAB-myotubes. **(A)** Graph of MTT assay of hMAB-myotubes exposed to 1, 10, 20, and 40 μM Dexamethasone for 24 hours. Data shown are the mean \pm SD ($n=5$). * p value < 0.05 . **(B)** Graph relative to the analysis of total nuclei number variations after 10, 20, and 40 μM Dexamethasone exposure for 24 hours. Data shown are the mean \pm SD (biological replicates=3, fields each replicate =4). *** p value < 0.001 . **(C)** Representative images of hMAB-derived myotubes, treated or not with 10, 20, and 40 μM Dexamethasone for 24 hours, stained with myosin heavy chain (MyHC) (red) and DAPI (blue) for nuclei. Scale bars: 50 μm . Graphs relative to analysis of fusion index%, nuclei per myotube, and myotube thickness after Dexamethasone exposure (20 and 40 μM for 24 hours). Data shown are the mean \pm SD (biological replicates=3, fields each replicate =4). ** p value < 0.01 , *** p value < 0.001 .

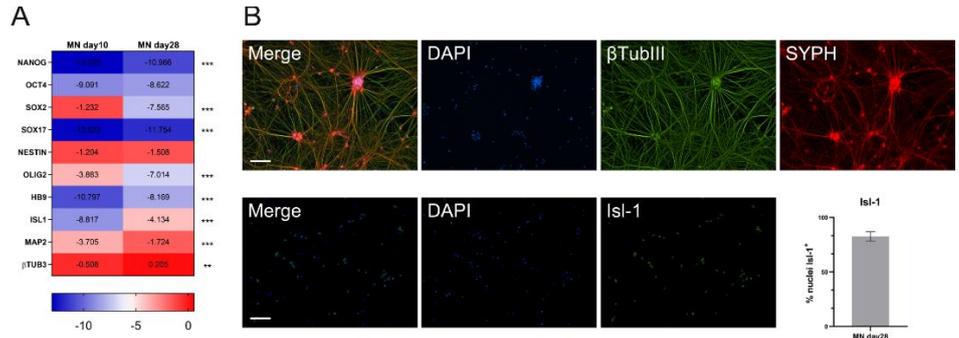

Figure S2. Differentiation of mature motor neurons derived from iPSCs. **(A)** Graph showing gene expression comparison between motor neurons at day 10 and 28 of differentiation for pluripotency, pan-neuronal, and motor neuron-specific markers. Data shown are the mean \pm SD (n=3). ***p* value < 0.01, ****p* value < 0.001 **(B)** Representative confocal images of MNs at day 28 of differentiation stained with β tubulinIII (β tubIII) (green), synaptophysin (SYPH) (red) – top –, and Islet-1 (Isl-1) (green) – bottom. Nuclei stained with DAPI. Scale bars: 75 μ m.

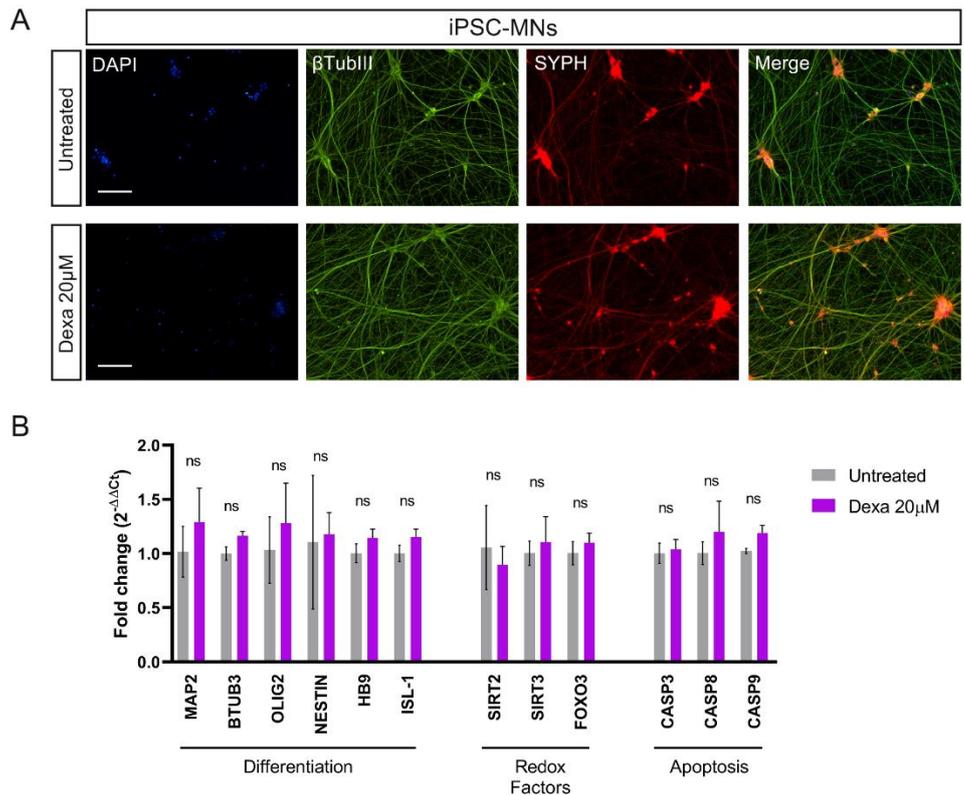

Figure S3. Dexamethasone effect on mature human iPSC-derived motor neurons. **(A)** Representative images of iPSC-derived motor neurons (iPSC-MNs) treated or not with 20 μ M Dexamethasone (24 h) stained with β tubulinIII (β tubIII) and synaptophysin (SYPH). Nuclei stained with DAPI. Scale bars: 75 μ m. **(B)** Graph showing gene expression comparison of neuronal differentiation, redox factor, and apoptosis markers of MNs treated or not with Dexamethasone. Data shown are the mean \pm SD (n=3).
