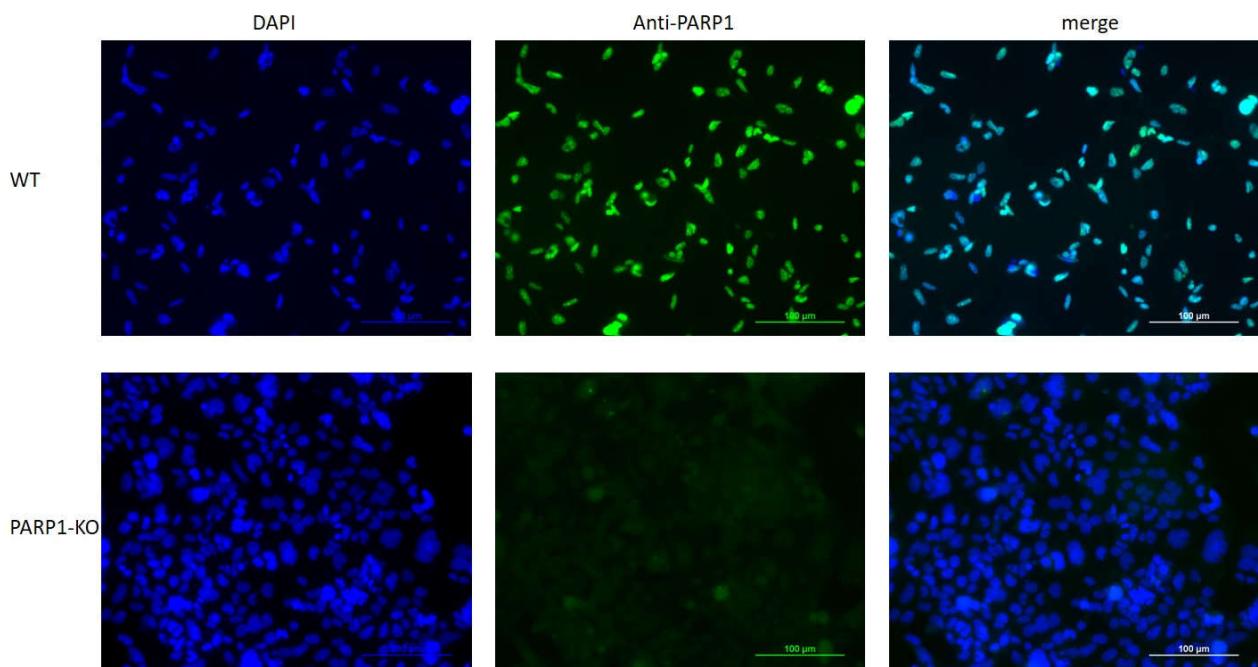

Figure S1. Scheme of deletion in *PARP1* gene (A). PCR analysis of CRISPR/Cas9-induced deletion (B): lanes: 1) H₂O; 2) PCR analysis of clone 1A3 genomic DNA with primers for detecting a deletion (PARP-Del-F and PARP-Del-R) in the *PARP1* protein gene; 3) PCR analysis of clone 1A3 genomic DNA with primers for the detection of wild-type alleles (PARP-In-F and PARP-In-R); 4) PCR analysis of intact genomic DNA of HEK293A cells with deletion detection primers (PARP-Del-F and PARP-Del-R); 5) PCR analysis of intact genomic DNA of HEK293A cells with primers for the detection of wild-type alleles (PARP-In-F and PARP-In-R) 6) DNA ladder Step100 (Biolabmix, Novosibirsk, Russia). Western-blot analysis (C): whole cell extracts were separated by Laemmli electrophoresis in 10% SDS-PAGE and were transferred on nitrocellulose membrane using semi-dry Western Blotting technique, and were probed with mouse antibody to PARP1 (Anti-Human PARP 556494, BD Biosciences) or rabbit antibody to β-actin (Abcam8226-100). Lanes: 1) HEK293A WT cells; 2) HEK293A clone 1A3; 3) purified PARP1 (20 ng); 4) purified PARP1 (50 ng); protein ladder (Thermo Fisher Scientific). Immunofluorescence analysis (D): WT and clone 1A3 cells were fixed in 4% formaldehyde and stained with DAPI or incubated with primary anti-PARP1 antibodies. Preparations were analyzed on the Nikon Ti fluorescence microscope using NIS Elements software.
