

Supplemental Figures and Tables

Table S1. Comparison statistics with reference genome Bt LLP29.

Sample	Total-Reads	Mapped (%)	Properly-Mapped (%)
LLP29-M19	14,602,840	98.45	98.04

Total-Reads: The number of Clean Reads; Mapped (%): The percentage of Clean Reads mapped to the reference genome in all Clean Reads; Properly-mapped (%): The paired-end sequencing sequences are mapped to the reference genome and the distance conforms to the length distribution of sequencing fragments.

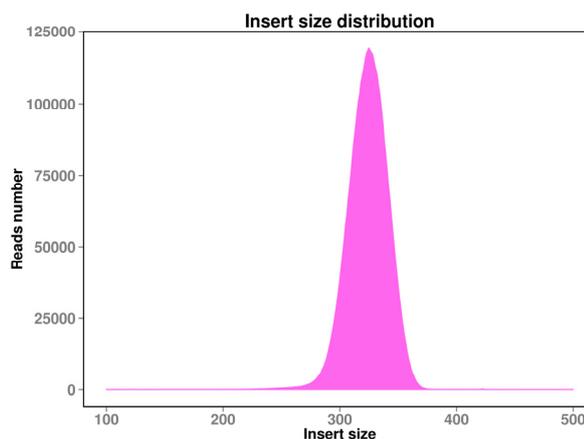

Figure S1. Distribution of Bt LLP29-M19 inserts. The abscissa is the length of the inserted fragment, and the ordinate is the number of corresponding reads.

Table S2. Statistics of SNPs detected by Bt LLP29-M29 and the reference genome.

SNP Number	Transition	Transversion	Ti/Tv	Heterozygosity	Homozygosity	Het-Ratio
1318	889	429	2.07	1085	233	0.17%

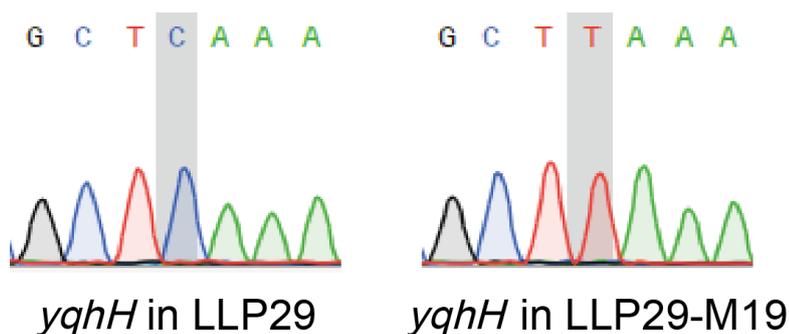

Figure S2. Sequence alignment of *yqhH* gene.

Table S3. Primers for vector construction, knockout and complementation, and validation of helicase activity.
