

Supplementary information

Supplementary information	1
Table S1: List of proteins, corresponding peptides	2
Table S2: List of the quantifications of the 62 proteins according to the different types of samples (plasma micro samples and Dried Blood Spots DBS) for each patient and expressed in z-score (cf Excelfile Supplemental Table 2).	4
Table S3: List of proteins and analytical performance of microsample multiplex analyses	5
Table S4: Descriptive and statistic results when comparing low IADL group to high IADL group.	7
Table S5: Optimized collision energy for the different peptide ions.....	13
Figure S1: LC-MRM chromatogram and calibration curves.....	32
Sup Methods	32
Chemicals used	32
Preparation of samples before mass spectrometry analysis.....	33
Mass Spectrometry Analysis.....	33
Stable isotopically labelled peptide mix	34
Precision study	38

Table S1: List of proteins, corresponding peptides

Protein names, sequence of the proteotypic peptides used for its mass spectrometry detection and Uniprot access number are reported. Link the the LabTestOnline description of the protein are provided, as well as the reference number in the French nomenclature of biological test and the corresponding reimbursement cost indicate in B (which corresponds to the cost unit (0.27€ in 2021) of the biological assays in France). (*) the five proteins corresponding the clinical trial main outcome.

Table S2: List of the quantifications of the 62 proteins according to the different types of samples (plasma micro samples and Dried Blood Spots DBS) for each patient and expressed in z-score (cf Excelfile Supplemental Table S2).

Table S3: List of proteins and analytical performance of microsample multiplex analyses

Protein names, analytical values of the mass spectrometry including the lower limit of quantification (LOQ) as provided by the PeptiQuant™ Biomarker Assessment Kit (BAK-76) from CIL (Cambridge Isotope Laboratories, Tewksbury, Massachusetts) except the 5 proteins added on this assay. Intra and inter-assay coefficient of variations (CV in %) which is the ratio of the standard deviation to the mean were provided.

Protein Name	Lower LOQ (ng/mL)	Intra-assay CV for plasma microsample	Intra-assay CV for DBS	Inter-assay CV using plasma QC

MedCalc® Statistical Software version 20.210 (MedCalc Software Ltd, Ostend, Belgium; <https://www.medcalc.org>; 2022)

Table S5: Optimized collision energy for the different peptide ions.

Protein name and corresponding peptide on endogenous form (.light) or isotopically labelled (.heavy). On each peptide transition parameters were indicated: precursor ion, fragment ion, collision energy used to generate this fragmentation and the indication of the fragment ion type. In addition, the retention time of the peptide was indicated.

Protein	Peptide	Precursor Ion (m/z)	Product Ion (m/z)	Collision Energy (V)	Ion Type	Retention Time (min)	Collision Energy	Ret Time (min)	Delta Ret Time	Ion Name

Figure S1: LC-MRM chromatogram and calibration curves

Panel A: LC-MRM chromatogram showing many eluting peptides (diagrammed with different colors and a three code letters corresponding to the three first amino-acids) over the peptide elution range (between 1 and 37 minutes). On the y axis, MS intensities of all the peptides were reported.

Sup Methods

Chemicals used

Serum (SST BD Vacutainer ® ref 368815) and plasma (EDTA K2 BD Vacutainer ® ref 367864) tubes.

DL-dithiothreitol (DTT), Iodoacetamide (IAA) from VWR (Radnor, USA)

AssayMAP Cartridge Reverse phase and C18 from Agilent technologies (Santa Clara, USA);

Acetonitrile ULC/MS, formic acid ULC/MS, Water ULC/MS from Biosolve (Dieuze, France);

Protein LoBind tubes 1.5 and 0.5 ml from Eppendorf (Hambourg, Germany).

Trizma® Hydrochloride (Tris-HCl) from Sigma Aldrich (Saint-Louis, USA);

Trypsin/LysC from Promega (Madison, USA)

Cryocheck™ Normal Reference Plasma, from Cryopep (Montpellier, France)

TFN-Specimen Collection card included in a DBS collection kit (Ref Art002) prepared by SpotToLab® (France).

Preparation of samples before mass spectrometry analysis

The sample preparation protocols were automated using an Automatic puncher (PerkinElmer, CT USA) and an Agilent AssayMap Bravo Liquid Handling Platform (Agilent Technologies, Lexington, USA).

In all the sample, a 6-mm diameter punch was cut out of the cards using an automatized DBS Puncher instrument (1296-071, PerkinElmer, CT USA).

The punch was placed in a 96-deep-well plate (ABgene 1127, Portsmouth, USA). Protein content of the sample was extracted, reduced and alkylated, before a protein digestion with trypsin using a protocol patented (WO/2020/234287). All these steps were performed on BRAVO AssayMap automate (Agilent, Lexington, USA).

Briefly to DBS sample, proteins were eluted with 200 μ L ammonium bicarbonate (50mM), mixed at 1500rpm over 30min; denatured by adding 200 μ L urea (8M) and shaken for 10 minutes (Sup Figure 1). Disulfide bridges were then reduced (21 μ L of DTT 0.2M, 12 μ L of Tris 1M pH 8.5) one hour at 37°C with stirring at 450rpm, and alkylated (18 μ L of IAA 1M, 6 μ L of Tris 1M pH 10) 30 minutes in the dark at 37°C with stirring at 450rpm. To stop the alkylation, 23 μ L DTT 0,2M was added. Sample was acidified with 10 μ L of formic acid and transfer into a new plate. Sample was cleaned on reverse phase tips (G5496-60086, Agilent T, Lexington, USA) following recommendation on the patent WO/2020/234287. Eluted samples were then dried on plate using a vacuum concentrator (Labconco, Kansas, USA). The tryptic digestion was carried out by resuspension of the sample with 2,8 μ g of Trypsin/LysC and 20 μ L of Tris 20 mM pH 8.5. The samples were incubated 14 hours at 37°C with shaking (450rpm). 3 μ L formic acid (pH<4) were added to stop the enzymatic reactions.

To the 2 μ L of plasma sample, sample preparation was also performed on BRAVO AssayMap automate (Agilent, Lexington, USA) with 96-well plate (PCR Eppendorf twin.tec® 96 LoBind, Eppendorf, Hambourg, Germany).

Normal Reference Plasma (Cryocheck™) was used as External quality control sample. This sample was analyzed in parallel in randomly select 8 positions in the 96-well plate. Inter-assay variability was calculated on these samples.

Briefly, plasma sample was denatured with 100 μ L of Urea 4,8 M in Tris 50 mM pH 8,5 and mixing at 450rpm during 30 minutes. Then 6 μ L of DTT 0.2M were added to perform the reduction. Thereafter the samples were incubated one hour at 37°C while shaking (450rpm). To alkylate the samples, 12 μ L of IAA 400mM in Tris 1M pH 10 were added. The samples were incubated 30 minutes at 37°C while shaking (450rpm). The tryptic digestion was carried out by a sample with 420 μ L of DTT 2 mM, Tris 20 mM pH 8.5 followed by 18 μ L of Trypsin/LysC (0.31 μ g/ μ L). The samples were incubated 14 hours at 37°C while shaking (450rpm). 6 μ L formic acid (pH<4) were added to stop the enzymatic reactions. The tryptic peptides were desalting with C18 Tips conditioned with 50 μ L of 70% ACN/0.1% FA and equilibrated with 50 μ L of 0.1% FA. Loaded samples were washed twice with 50 μ L of 0.1% FA and eluted with 50 μ L of 70% ACN/0.1% FA. Elutions were dried by centrifugal evaporation on Speedvac (Labconco, Kansas, USA).

Mass Spectrometry Analysis

Before injection, samples were resuspended in 20 μ L of 2% acetonitrile/0.1% formic acid/97.9% water and spiked with “Stable isotopically labelled peptide mix” described below. Samples were stirred for 10 min. Then they were centrifuged three minutes at 16000g. The liquid was transferred in polypropylene vials, ready for

analysis. All samples prepared were injected in duplicate. Between each measurement, a blank was measured to avoid carry-over.

LC separation of tryptic peptides was carried out on a UHPLC Nexera LC-40 liquid chromatography system (Shimadzu Corporation, Kyoto, Japan). Peptides were resolved using a reversed-phase column (Shim-pack GISSFTF-HP C18, 3 µm, 150× 2.1 mm) at a flow rate of 400 µL/min, and a temperature at 50°C.

A 48 min multistep gradient was performed using solvent B (99.9% acetonitrile and 0.1% formic acid), starting with 3% and increasing to 5% in 1.5 min, to 14% at 16 min, to 16% at 18 min, to 25% at 38 min. At 39 min, the column was flushed for 4 min with 80% of solvent B and then reconditioned with 3% of solvent B for 4 min.

Peptide analyses were carried out on a QqQ MS system (LCMS-8060, Shimadzu Corporation, Kyoto, Japan) in positive ion mode. The ESI source was set as follows: DL: 150°C, heat block: 250°C, interface: 400°C, nebulizer gas: 2 L/min, drying gas: 5 L/min, heating gas: 15 L/min. The Mass Spectrometer operated in scheduled MRM mode with a time windows of 3 minutes and a maximum loop time of 1.172s. Quadrupole resolution was unit to Q1 and Q3. CID gas pressure was fixed to 350 kPa. Collision energies (CE) were optimized for all the peptide transitions of interest (Sup Table 5). Finally, in our LC-MRM experiment 91 peptides were monitored corresponding to 66 proteins.

LabSolutions software (version 5.97) was used for data acquisition. Open-source Skyline® 20.2 software (<https://skyline.ms/project/home>) was used to analyse MRM data. The peak detection was performed automatically by the software and checked manually. Excel software was used to compute the ratio heavy/light.

Stable isotopically labelled peptide mix

PeptiQuant™ Biomarker Assessment Kit (BAK-76) from CIL (Cambridge Isotope Laboratories, Tewksbury, Massachusetts) (reference: BAK-A6495-76) was used to normalize the MS signal of 101 peptides corresponding to 76 proteins (see below). 4µL of the SIS (Stable Isotope Standards) peptide mixture were spiked to each sample.

Protein Name	Peptide	UniProt KB Accession No.	SIS added in ng/mL

Some additional targets were added on this panel. One more peptide was added to C-reactive protein (ESDTSYVSL[¹³C₆]K), and one transthyretin peptide (AADDTWEPFASGK[¹³C₆, ¹⁵N₂]), one albumin peptide (L[¹³C₆]VNEVTEFAK), and two orosomucoid (ORM) or Alpha-1-acid glycoprotein 1 (AGA) peptides (TEDTIFL[¹³C₆]R; WFYIASAFR[¹³C₆, ¹⁵N₄]) were also added. SIS peptides were produced by PeptideSynthetics (Fareham, UK) with a purity up to 98%. Home made mix was spiked into the digested samples with 5 fmol of ESDTSYVSL[¹³C₆]K; 10 fmol of AADDTWEPFASGK[¹³C₆, ¹⁵N₂]; 50 fmol of L[¹³C₆]VNEVTEFAK; 10 fmol of TEDTIFL[¹³C₆]R; and 200 fmol of WFYIASAFR[¹³C₆, ¹⁵N₄]).

Limit of quantification on MS assay

Performances were provided with the PeptiQuant™ Biomarker Assessment Kit (BAK-76) from CIL (Sup Table3)

To the added peptides, an increasing quantity of heavy peptides were added in digested normal plasma to determine the LOQ. LOQ was determined by the lowest points with a deviation from target of less than 20%. These analyses were performed in duplicates. L[¹³C₆]VNEVTEFAK was spiked at 0, 4, 10, 20, 30 and 37.5 fmol in 2µL of digested plasma. AADDTWEPFASGK[¹³C₆, ¹⁵N₂] was spiked at 0, 0.2, 0.4, 0.6, and 0.8 fmol in 2µL of digested plasma. ESDTSYVSL[¹³C₆]K was spiked at 0, 0.01, 0.2, 0.6, and 2.4 fmol in 2µL of digested plasma. TEDTIFL[¹³C₆]R was spiked at 0, 0.8, 1.6, 3.2, and 4.8 fmol in 2µL of digested plasma. WFYIASAFR[¹³C₆, ¹⁵N₄] was spiked at 0, 16, 24, 32, 80 and 120 fmol in 2µL of digested plasma.

Precision study

Intra-assay variability was calculated on replicate analysis of plasma and DBS samples.

Inter-assay variability was calculated on 8 QC of Normal reference plasma. A coefficient of variation was calculated on these 8 values.
