### Modification of cellulose substrate - incorporation of a triazine linker immobilized on cellulose

A procedure previously developed by us was used to obtain the isocyanurate derivative of amino acid attached to cellulose [1].

#### *Immobilization of 2,4-dichloro-6-methoxy-1,3,5-triazine (DCMT) on cellulose*

Whatman 1 CHR cellulose sheets (4 pieces) on dimensions 10 x 15 cm, were treated with 1.0 M aq. NaOH (500 mL) for 30 min. The base solution was then removed, and the cellulose sheets were dried with a paper towel. In the next step, they were treated with 1.2 M solution of 2,4-dichloro-6-methoxy-1,3,5-triazine (DCMT) (111 g, 0.6 mol) in THF (500 mL). Solid, finely powdered NaHCO<sub>3</sub> (50.4 g, 0.6 mol) and diisopropylamine (DIPEA) (108 mL, 0.6 mol) were added to the solution. After 3 hours the solution was removed, and the cellulose was washed sequentially with THF (3 x 150 mL), acetone (3 x 150 mL), and CH<sub>2</sub>Cl<sub>2</sub> (3 x 150 mL) and allowed to air dry.

#### *Functionalization of DCMT-modified cellulose with N-methylmorpholine (NMM)*

DCMT-modified cellulose sheets were treated with a solution of N-methylmorpholine (NMM) in THF (v: v 1: 1) (200 mL). The reactions were carried out for 30 minutes by vigorously shaking the mixture. The NMM solution was then removed and the cellulose sheets were washed with THF (2 x 150 mL, 5 min) and dried with a paper towel.

#### *C-terminal Fmoc-glycine incorporation (synthesis of Fmoc-Gly triazine ester immobilized on cellulose)*

Cellulose sheets functionalized with DCMT and N-methylmorpholine (NMM) (4 pieces) were treated with Fmoc-Gly-OH (4.46 g, 15 mmol), (825  $\mu$ L, 7.5 mmol) in 100 mL THF : dichloromethane (DCM) (1 : 1). The reaction was carried out for 1.5 h with gentle shaking.

The solution was then removed, the cellulose sheets were washed with DMF (2 x 150 mL) for 5 min and CH<sub>2</sub>Cl<sub>2</sub> (2 x 150 mL) for 5 min and then dried with a paper towel.

#### *Thermal rearrangement of the Fmoc-Gly triazine ester immobilized on cellulose*

The dried Fmoc-Gly triazine ester modified cellulose sheets were heated in refluxing toluene for 8 h. The solvent was then removed, the sheets were dried with a paper towel and dried in a vacuum desiccator until constant weight.

#### *Acetylation of a cellulose matrix modified with an isocyanurate derivative of Fmoc-Gly*

The cellulose sheets were treated with a 10% solution of acetic anhydride (5 mL, 0.088 mol) in DMF (35 mL) in the presence of a 20% solution of diisopropylethylamine (10 mL, 0.057 mmol). After 30 min of gentle shaking, the acetylation mixture was removed, and the cellulose sheets were washed with DMF (2 x 50 mL) 5 min, CH<sub>2</sub>Cl<sub>2</sub> (2 x 50 mL) 5 min, and C<sub>2</sub>H<sub>5</sub>OH (3 x 50 mL) 5 min and again

$\text{CH}_2\text{Cl}_2$  (2 x 50 mL) ) 5 min. The solvent was then removed, and the sheets were dried with a paper towel and dried in a vacuum desiccator until constant weight.

***Fmoc deprotection from the C-terminal glycine residue immobilized on cellulose***

The Fmoc group from the amine glycine function was removed by treatment with 25% piperidine in DMF (40 mL). The cellulose sheets immersed in the solution were gently shaken for 30 min, then the solution was removed, the cellulose sheets were washed in 5-minute cycles with DMF (3 x 40 mL). The synthesis scheme is shown in Figure S1.

**Figure S1.** Cellulose functionalization resulting in a cellulose matrix useful in SPOT synthesis of peptide library.

The obtained modified cellulose was used in the automatic SPOT synthesis [1]. The synthesis was performed using a synthetic protocol developed by us using triazine condensing reagents [2].

### Automatic SPOT synthesis of the library of EGF fragments

Detailed protocols and reports from Intavis' SPOT ResPep SL automatic synthesizer are presented below.

*Incorporation of the first amino acid. Report on the work of the automatic synthesizer*

```
