

## Supplement

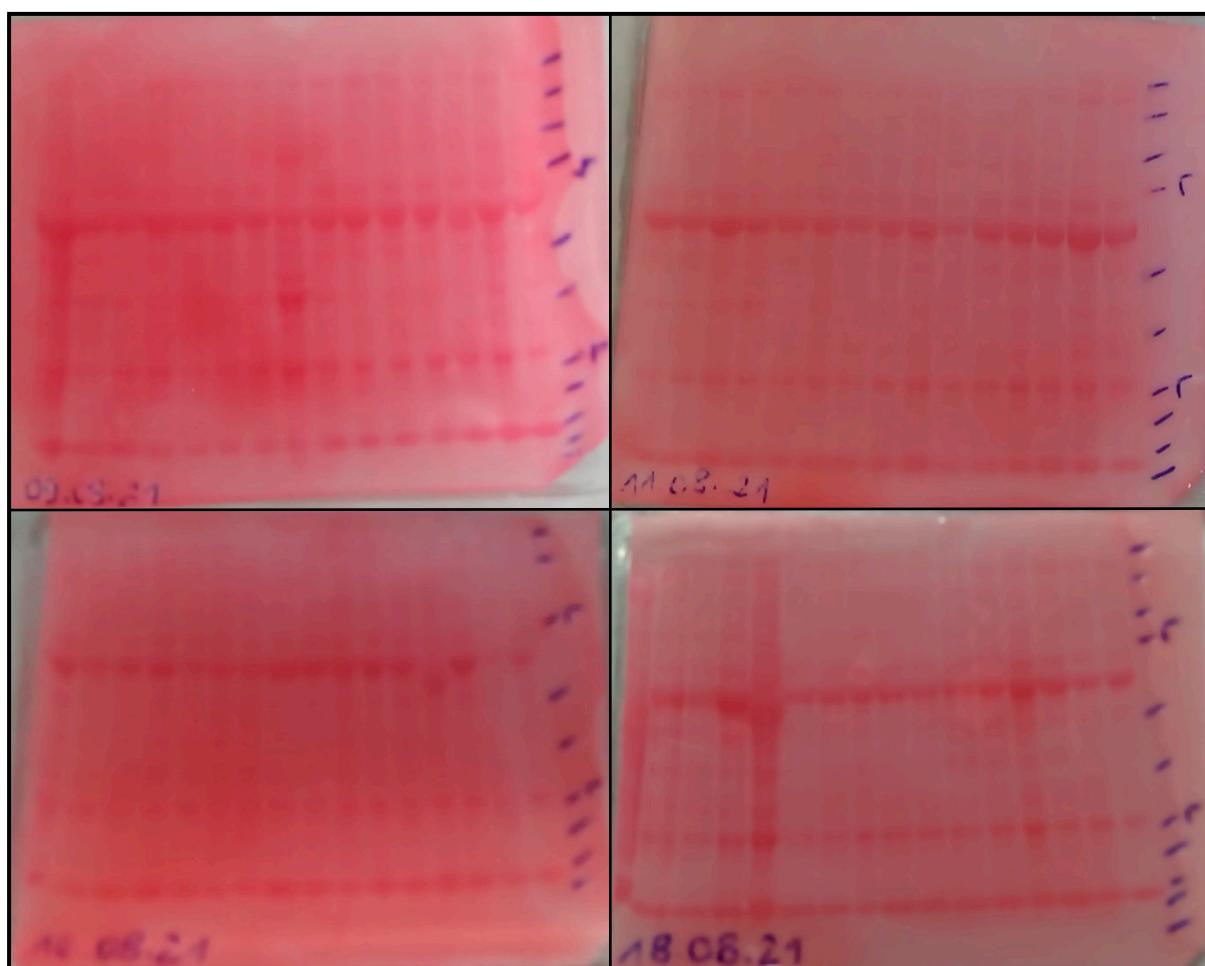

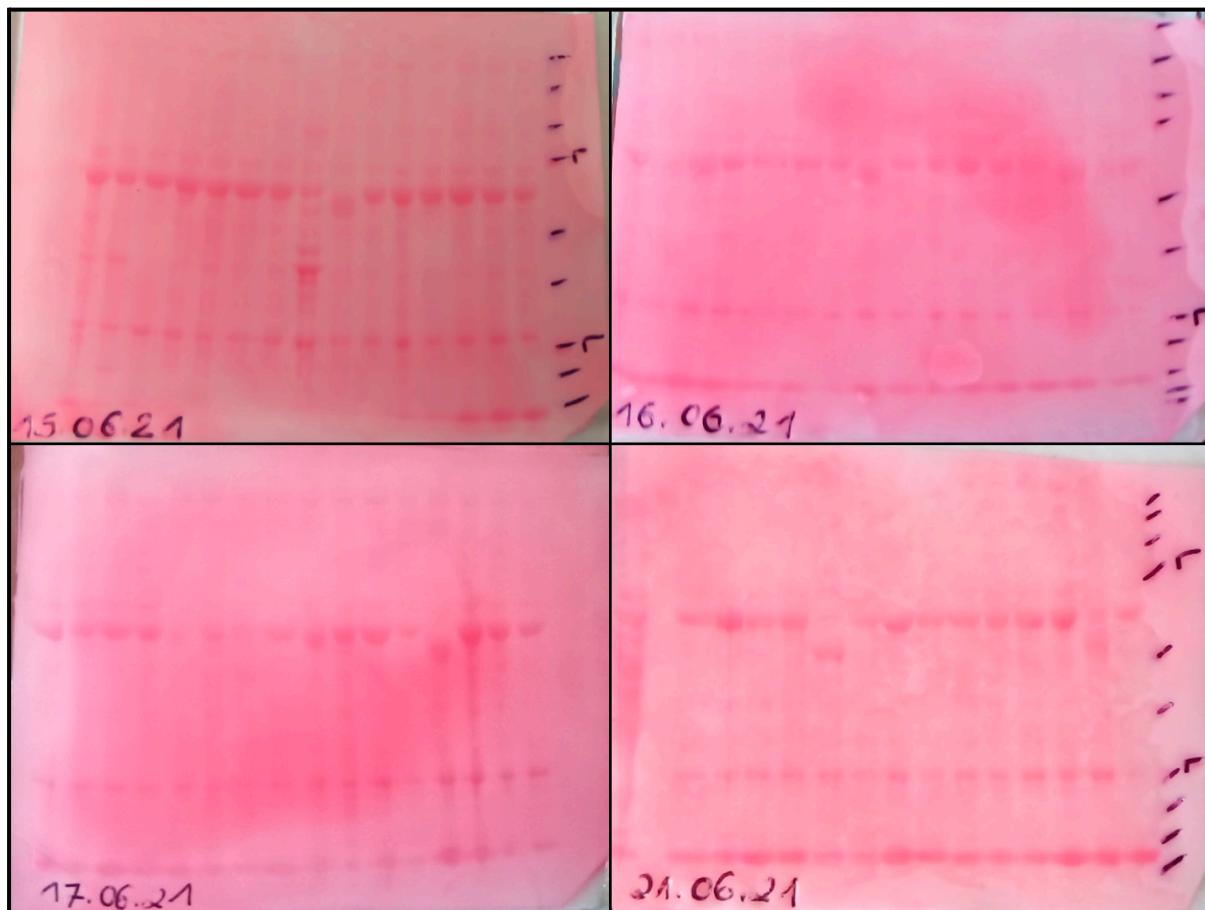

### Figure S1

a. Chemiluminescence detection of the membranes incubated with the primary antibodies against PerilipinA, HSL, hepcidin, Glut4 and e IR $\beta$  and the respective secondary antibodies, (HRP-conjugated).

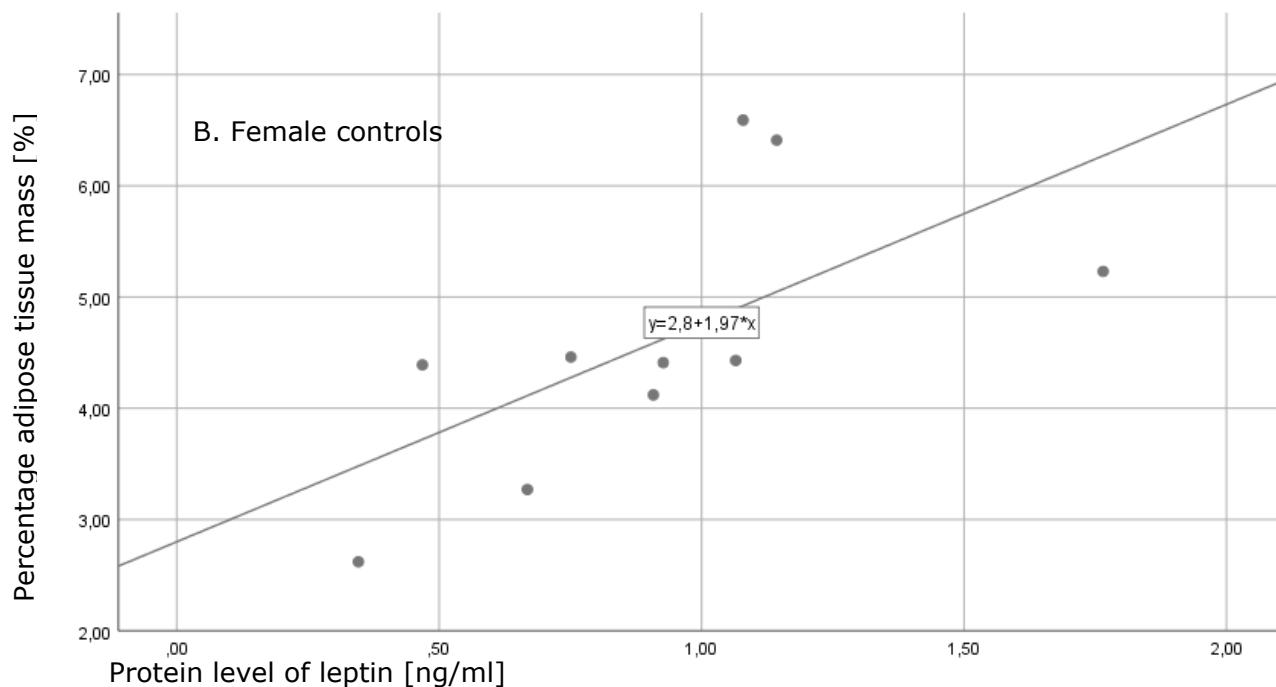

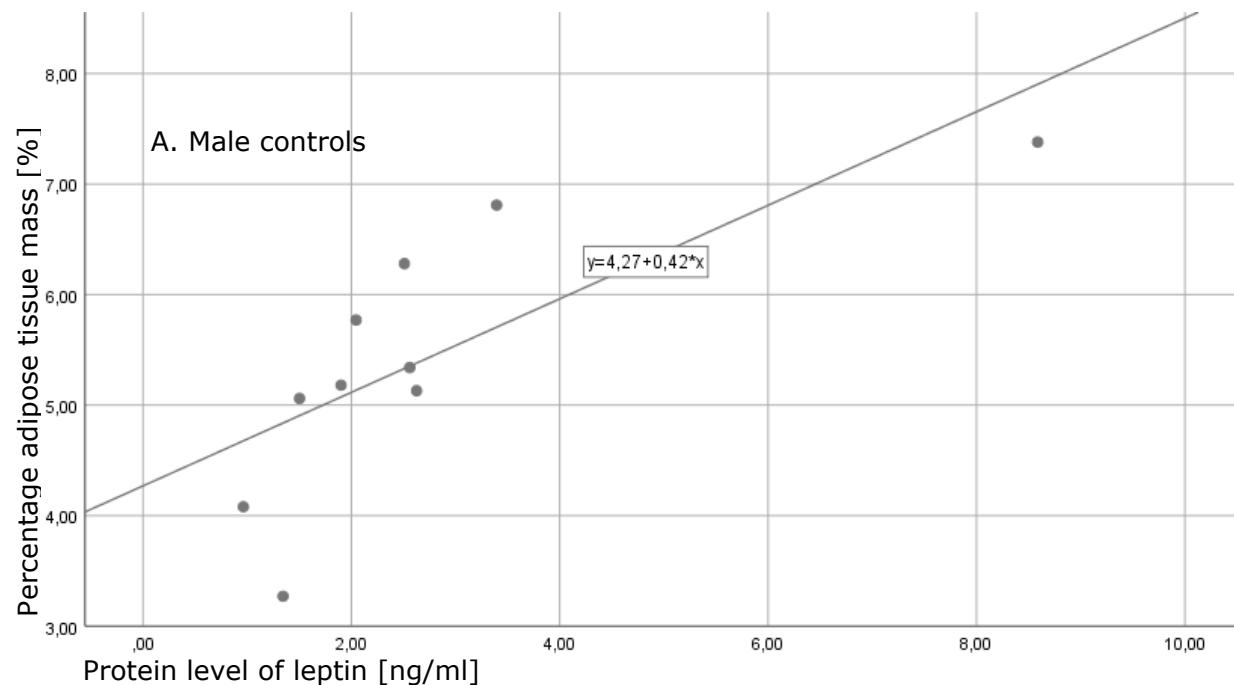

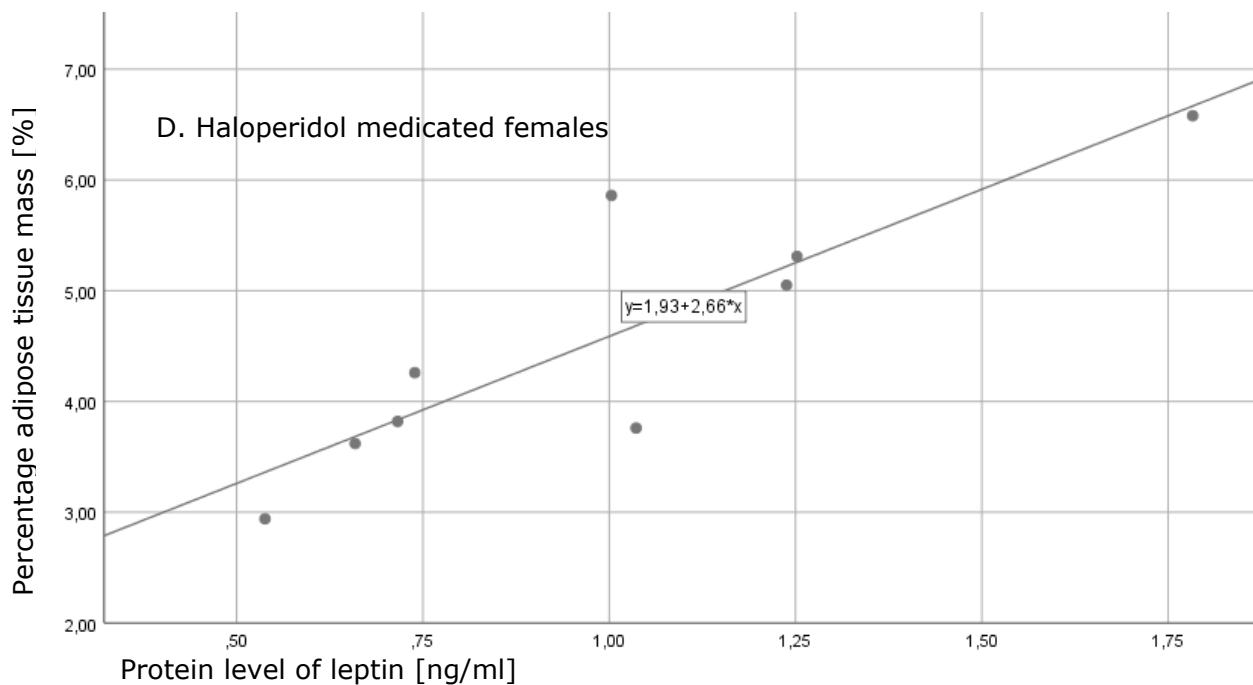

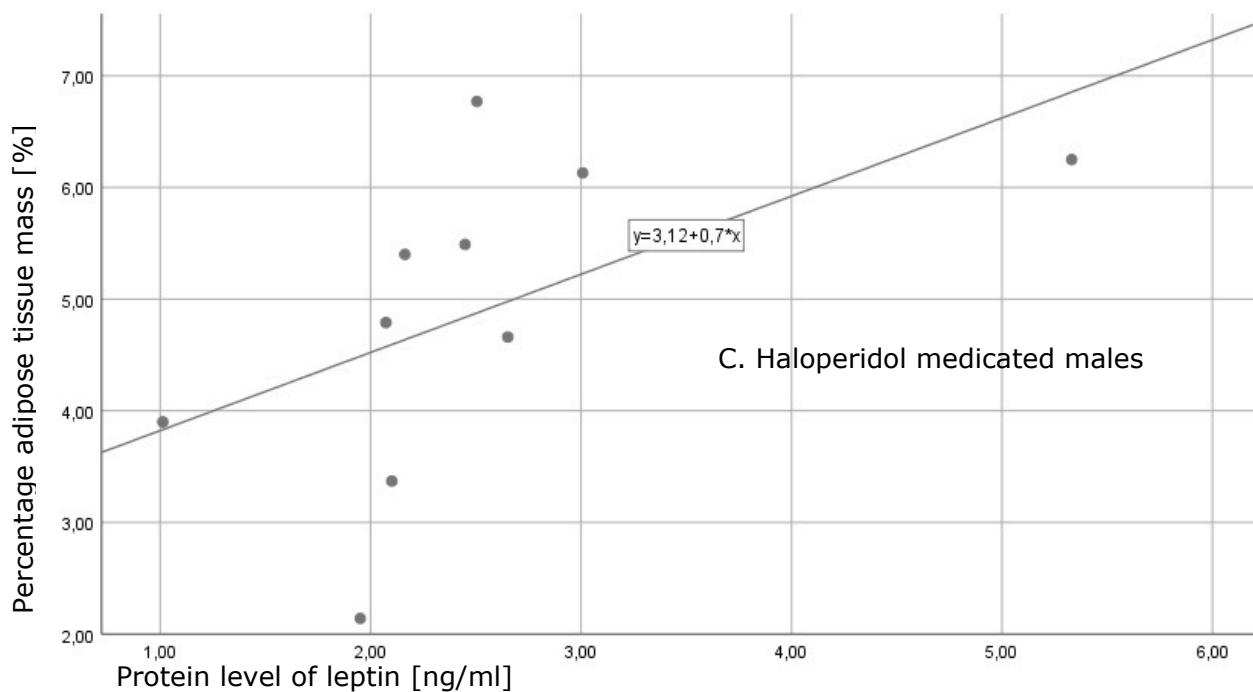

b. Westernblot membranes stained with Ponceau red

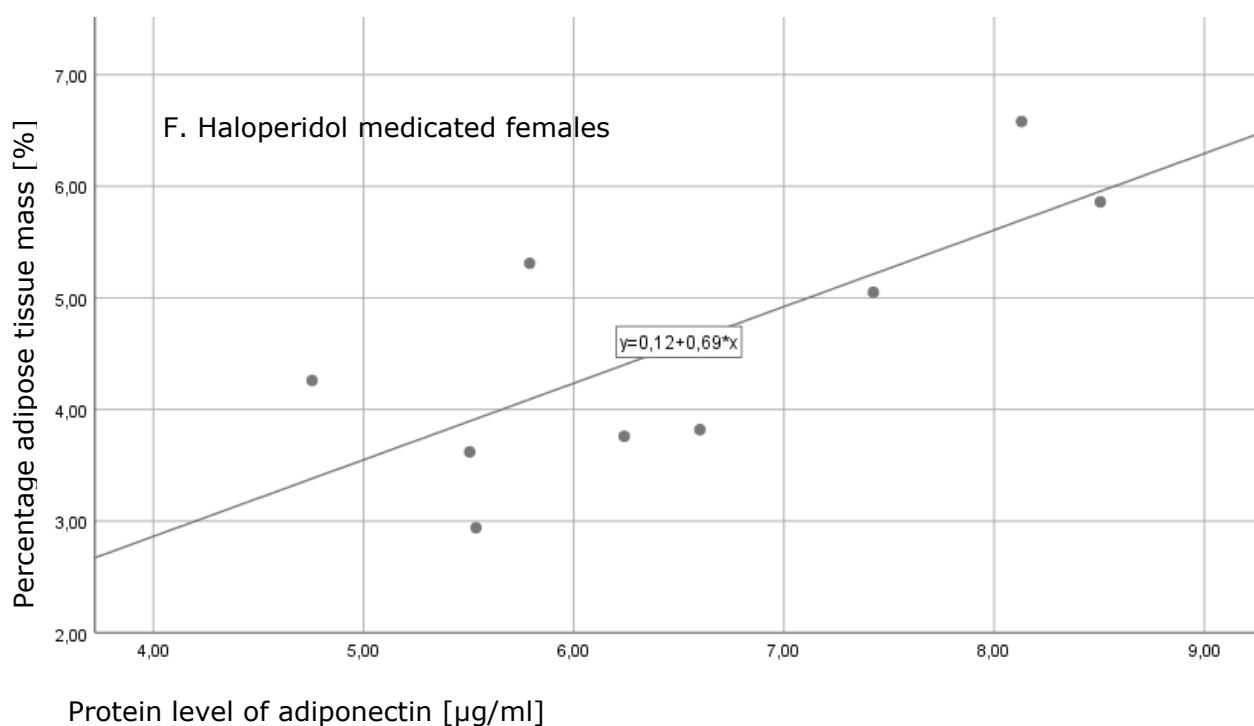

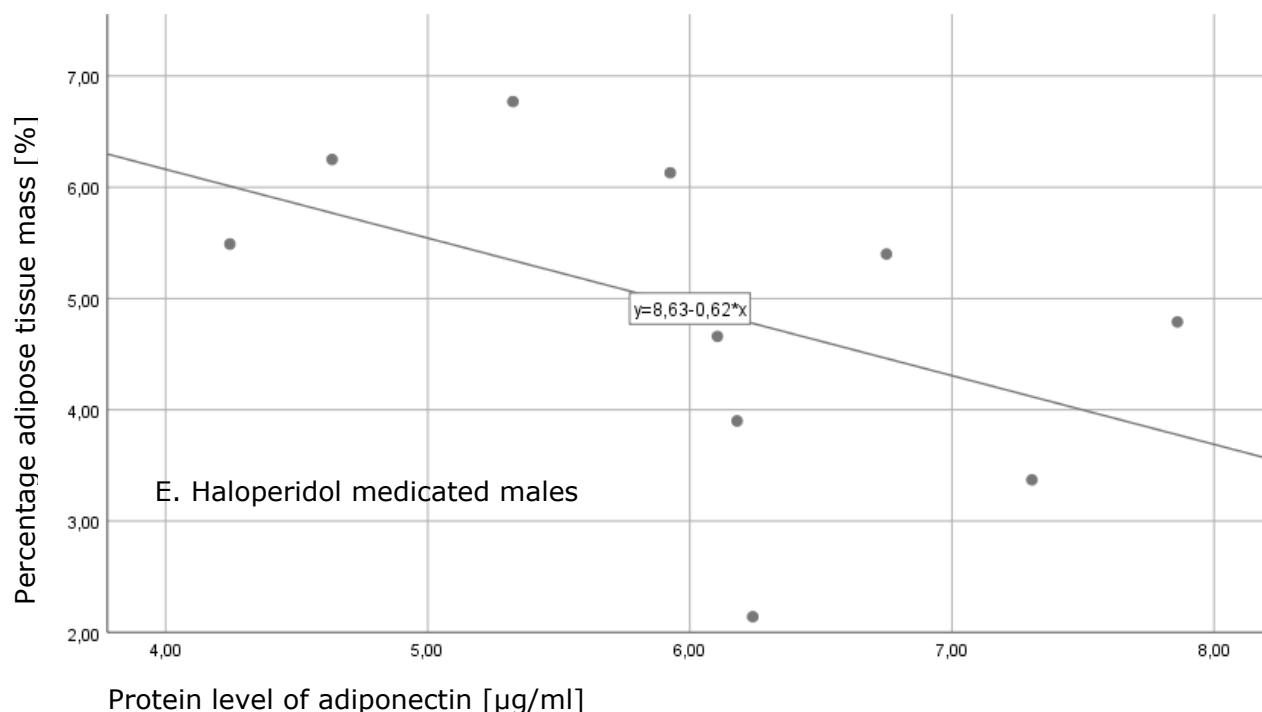

**Figure S2**

A.-D. Nonparametric correlation of protein level of leptin (abscissa) and percentage adipose tissue mass (ordinate) for male and female controls, and male and female haloperidol medicated SD rats.

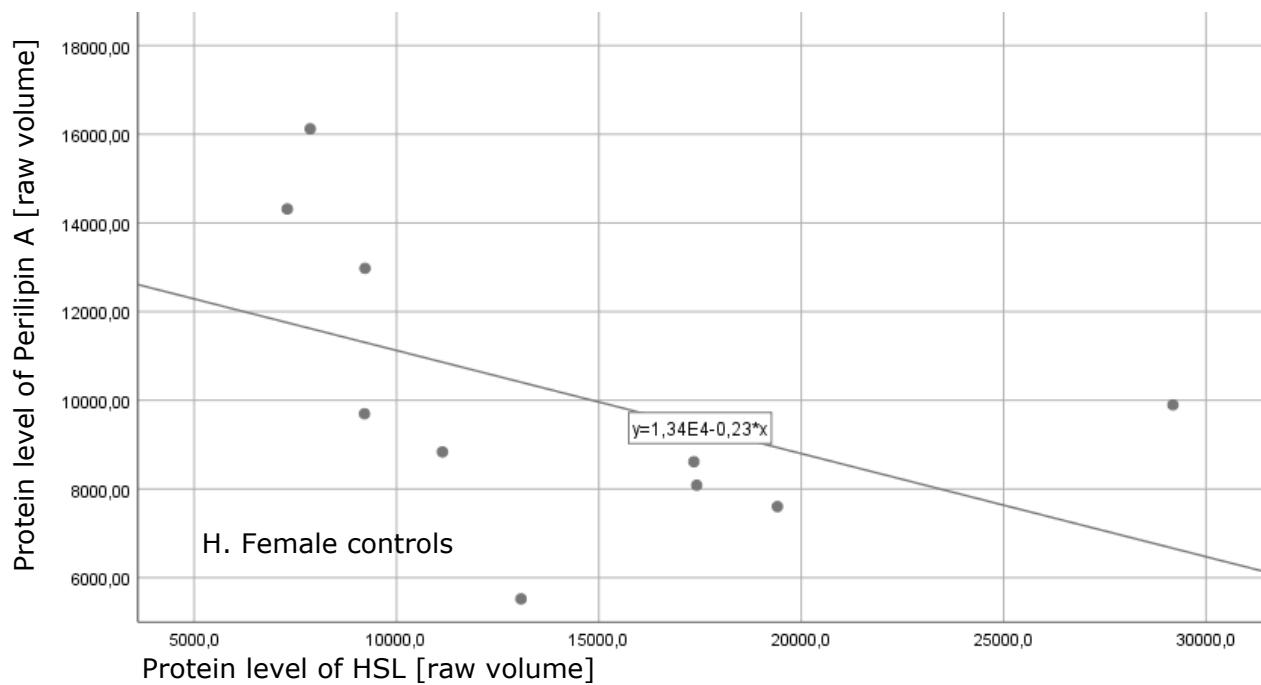

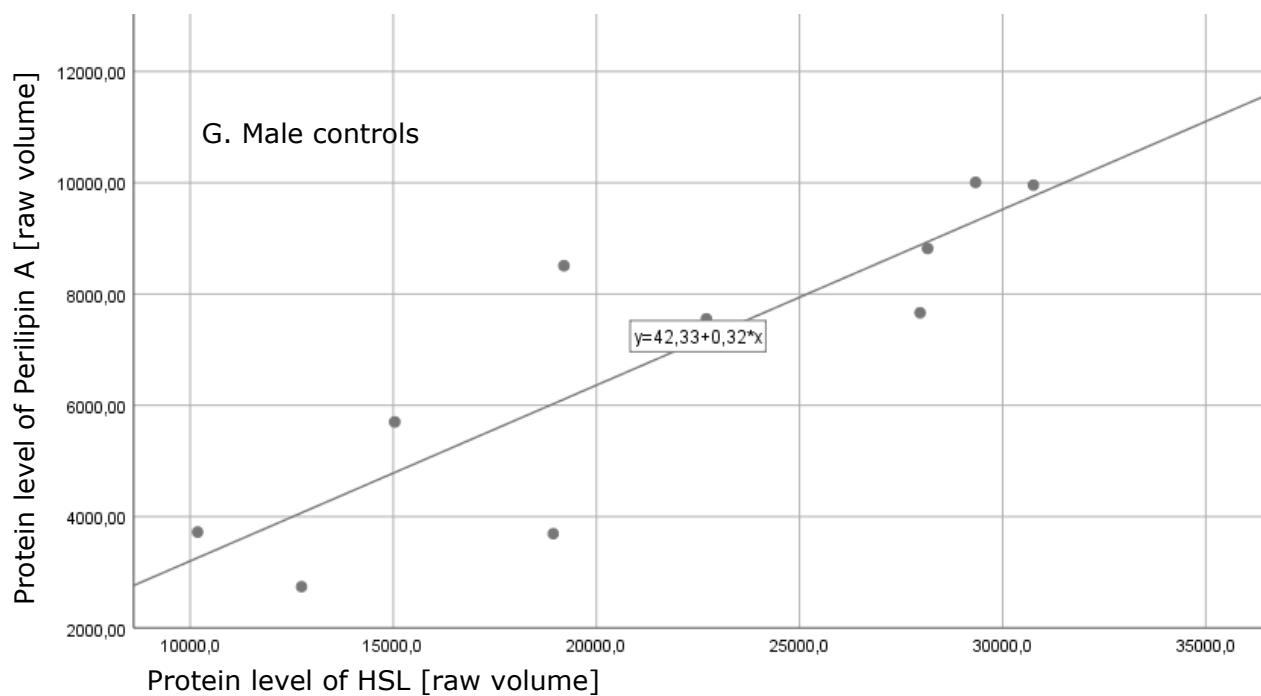

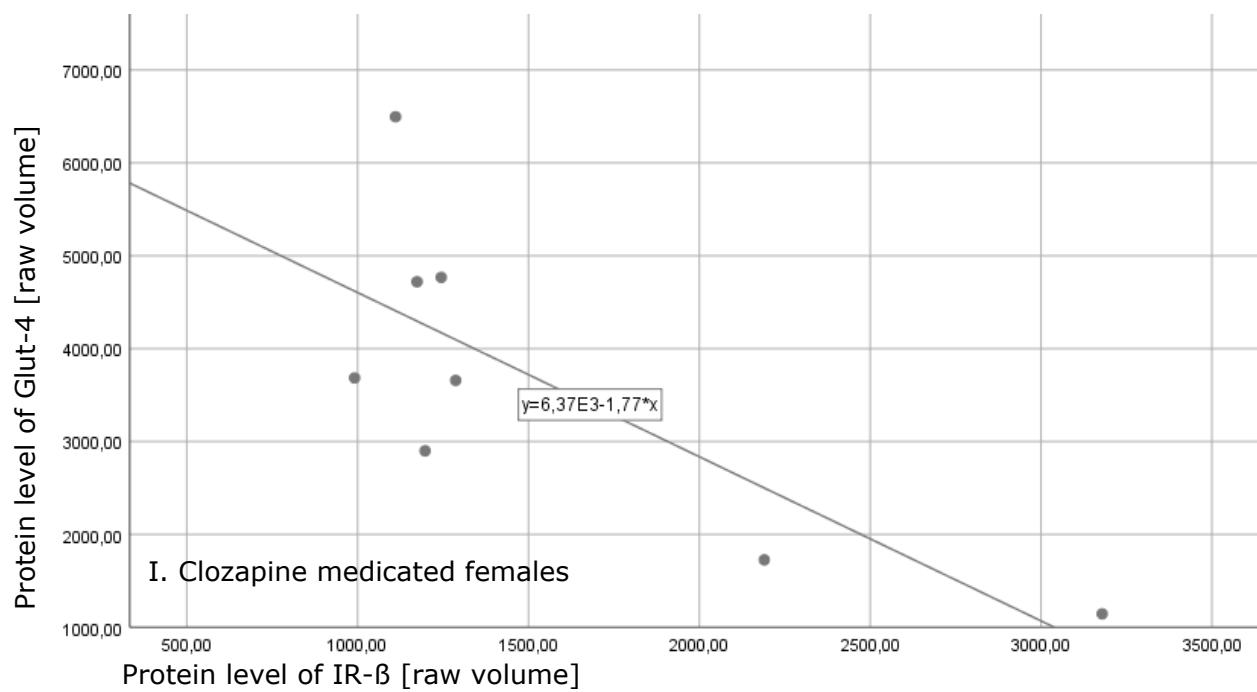

E.-F. Nonparametric correlation of protein level of adiponectin (abscissa) and percentage adipose mass of male and female haloperidol medicated SD rats.

G.-H. Nonparametric correlation of HSL (abscissa) and PerilipinA (ordinate) of male and female control SD rats (HSL=hormon sensitive lipase).

I. Nonparametric correlation of IR- $\beta$  (abscissa) and Glut-4 (ordinate) of female clozapine medicated SD rats (IR- $\beta$ = insulin receptor- $\beta$ ; Glut-4= glucose transporter-4).

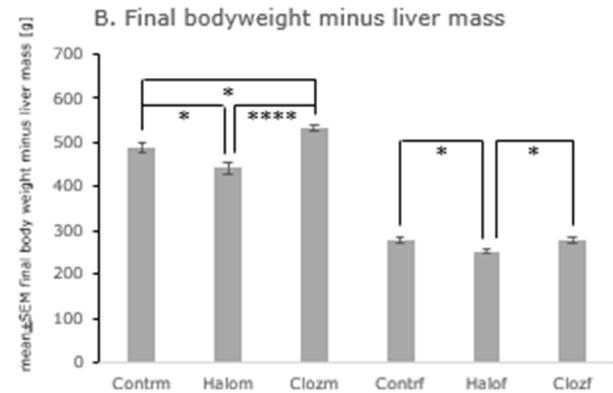

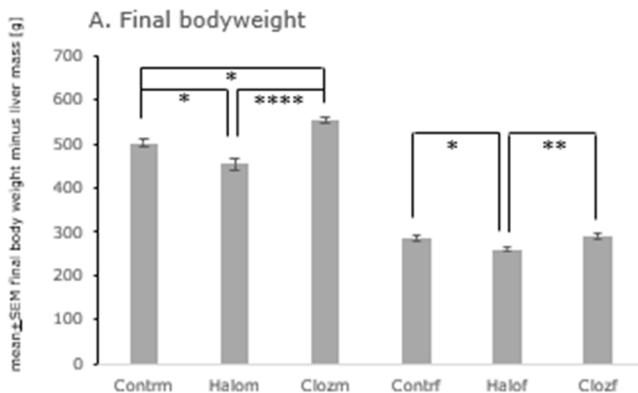

### Figure S3

A. Final body weight (body weight gain over 12-weeks was shown in [23])

B Final body weight minus liver mass (liver mass was examined in [24])

C Final body mass minus adipocyte mass

D Final body weight minus liver and adipocyte mass

Two-way ANOVA showed differences for:

#### A. Final bodyweight

Medication[F(2,54)=27.0 p<0.000001], SEX[F(1,54)=1010.3 p<0.000001] and MEDICATIONxSEX [F(2,54)=8.55 p=0.001]. Posthoc-tests:

Higher final bodyweight in the male (p=0.010) clozapine treated group, lower final body weight in the male (p=0.013) and female (p=0.021) haloperidol group, and between haloperidol or clozapine treated males (p=0.000003) and females (p=0.009)

#### B. Final bodyweight minus liver mass

Medication[F(2,54)=24.4 p<0.000001], SEX[F(1,54)=997.1 p<0.000001] and MEDICATIONxSEX [F(2,54)=7.7 p=0.001]. Posthoc-tests:

Higher final bodyweight in the male (p=0.018) clozapine treated group, lower final body weight in the male (p=0.016) and female (p=0.025) haloperidol group, and between haloperidol or clozapine treated males (p=0.000007) and females (p=0.014)

#### C. Final bodyweight minus perirenal fat mass

Medication[F(2,54)=29.5 p<0.000001], SEX[F(1,54)=1226.8 p<0.000001] and MEDICATIONxSEX [F(2,54)=8.3 p=0.001]. Posthoc-tests:

Higher final bodyweight in the male (p=0.010) clozapine treated group, lower final body weight in the male (p=0.007) and female (p=0.013) haloperidol group, and between haloperidol or clozapine treated males (p=0.000001) and females (p=0.006)

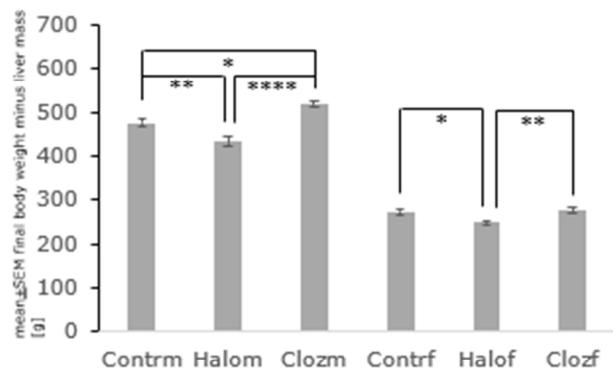

#### D. Final body weight minus liver mass minus perirenal fat mass

Medication[F(2,54)=26.4 p<0.000001], SEX[F(1,54)=1216.3 p<0.000001] and MEDICATIONxSEX [F(2,54)=7.4 p=0.001]. Posthoc-tests:

Higher final bodyweight in the male (p=0.021) clozapine treated group, lower final body weight in the male (p=0.008) and female (p=0.015) haloperidol group, and between haloperidol or clozapine treated males (p=0.000004) and females (p=0.010)

\* p<0.05; \*\* p<0.01 \*\*\*\* p<0.00001

#### C. Final body weight minus perirenal fat

#### D. Final body weight minus liver mass minus perirenal fat mass
