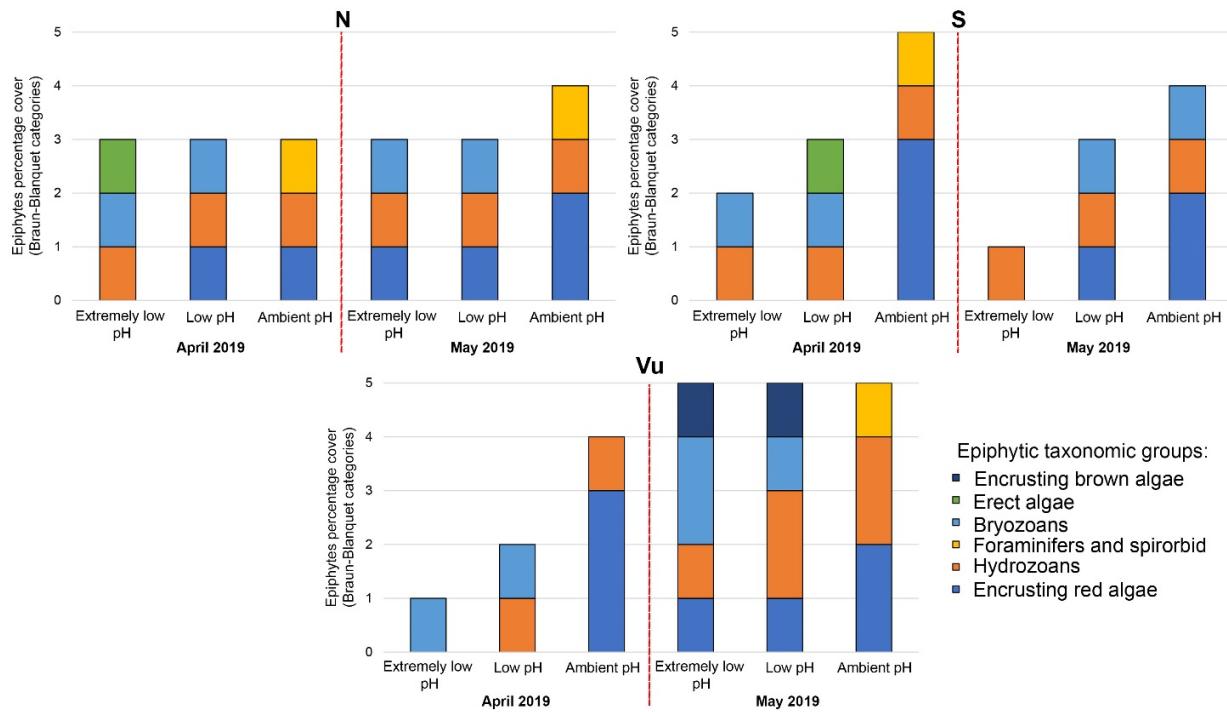

**Figure S2.** pH trend (from SeaFET pH-meter in situ) at North (N) and South (S) of Castello Aragonese, and Vullatura (Vu) measured in situ through hourly acquisition for more than twenty-three days (data kindly provided by Juhyong Lee during the experimental phase of his pH thesis (Stanford University, USA) [59]. Data are indicative of the general trend and temporal variability among sites, while actual single values may be considered with caution due to calibration problems and corrections still in progress.

**Table S1.** Mean  $\pm$  SD leaves length values and significant levels of pairwise *t*-test comparison among pH conditions and months ( $^{**} = p\text{-value} < 0.001$ ;  $^{*} = p\text{-value} = 0.01$ ;  $p\text{-value} > 0.05$ ).

**Figure S3.** Mean leaf length of *P. oceanica* measured in the months of April 2019 (light green) and May 2019 (dark green) along the pH gradient at Castello Aragonese North (N) and South (S) sides vents, and Vullatura vent (Vu).

**Figure S4.** Percentage coverage (expressed as Braun-Blanquet categories) of taxonomic groups composing the epiphytic assemblages of *P. oceanica* leaves, in the months of April 2019 and May 2019, respectively, along the pH gradient at Castello Aragonese North and South (N and S) sides vents, and Vullatura (Vu) vent.

**Figure S5.** Common taxa found in the artificial collectors.
