## OREAS

62e: Au 9.13ppm, Ag 9.86ppm, Au 9.37ppm, primary state, matrix meta-andesite, mineralisation low sulphidation epithermal, major elements: S 0.4\%, Si 30.71\%, As 11.3ppm, Fe $2.95 \%$, Ba 343ppm, Cu 68ppm, Li 50ppm, Ва 30ppm, Са 3.88\%.

991: Au $47.04 \mathrm{ppm}, \mathrm{Cu} 20.66 \mathrm{wt} \%, \mathrm{Ag} 48.14 \mathrm{ppm}$, primary, concentrate matrix, porphyry copper gold.
Major elements reported by the provider: S 30.77\%, As 170ppm, $\mathrm{Bi}<50 \mathrm{ppm}, \mathrm{Ca} 1 \mathrm{wt} \%, \mathrm{Cd}<10 \mathrm{ppm}, \mathrm{Co}$ 122ppm, Fe 27wt\%, Mg 0.5wt\%, Mo 490ppm, Ni 32ppm, Pb 123ppm, S 30.77wt \% , Sb 80ppm

ROCKLABS

SP72: Origin: Feldspar minerals, basalt and iron pyrites with minor quantities of finely divided gold and silver-containing minerals that have been screened to ensure there is no gold nugget effect.

Composition: Au 18.16ppm, Ag 83ppm, other uncertified values: $\mathrm{SiO}_{2} 55.88 \%, \mathrm{Al}_{2} \mathrm{O}_{3} 16.21 \%, \mathrm{Na}_{2} \mathrm{O}$

SN74: Origin: Feldspar minerals, basalt and iron pyrites with minor quantities of finely divided gold and silver-containing minerals that have been screened to ensure there is no gold nugget effect. Composition: Au 8.981ppm, Ag 51.5 ppm , other uncertified values: $\mathrm{SiO}_{2} 55.92 \%, \mathrm{Al}_{2} \mathrm{O}_{3} 16.03 \%, \mathrm{Na} \mathrm{O}$ $4.54 \%, \mathrm{~K}_{2} \mathrm{O} 5.45 \%$, $\mathrm{CaO} 3.14 \%, \mathrm{MgO} 3.04 \%, \mathrm{TiO}_{2} 0.79 \%$, $\mathrm{MnO} 0.06 \%, \mathrm{P}_{2} \mathrm{O}_{5} 0.21 \%, \mathrm{Fe}_{2} \mathrm{O}_{3} 4.18 \%, \mathrm{Fe} 3.0 \%$, S 3.3\%.

SQ88: Origin: Feldspar minerals, basalt and iron pyrites with minor quantities of finely divided gold and silver-containing minerals that have been screened to ensure there is no gold nugget effect. Composition: Au 39.72 ppm , Ag 160.8 ppm , other uncertified values: $\mathrm{SiO}_{2} 47.31 \%, \mathrm{Al}_{2} \mathrm{O}_{3} 13.64 \%, \mathrm{Na}_{2} \mathrm{O}$ $3.75 \%$, $\mathrm{K}_{2} \mathrm{O} 4.37 \%, \mathrm{CaO} 2.96 \%, \mathrm{MgO} 2.67 \%, \mathrm{TiO}_{2} 0.77 \%$, $\mathrm{MnO} 0.07 \%, \mathrm{P}_{2} \mathrm{O}_{5} 0.21 \%, \mathrm{Fe}_{2} \mathrm{O}_{3} 3.71 \%, \mathrm{Fe} 8.8 \%$, S 10\%.

HiSilP3: Origin: A highly siliceous matrix with minor quantities of clay, iron pyrites and finely divided gold-containing minerals that have been screened to ensure there is no gold nugget effect. Composition: Au 12.24ppm, other uncertified values: $\mathrm{SiO}_{2} 90.35 \%, \mathrm{Al}_{2} \mathrm{O}_{3} 2.98 \%, \mathrm{Na}_{2} \mathrm{O} 0.08 \%, \mathrm{~K}_{2} \mathrm{O}$ $0.22 \%, \mathrm{CaO} 0.06 \%, \mathrm{MgO} 0.06 \%, \mathrm{TiO}_{2} 0.14 \%, \mathrm{MnO} 0.01 \%, \mathrm{P}_{2} \mathrm{O}_{5} 0.2 \%, \mathrm{Fe}_{2} \mathrm{O}_{3} 0.75 \%$, $\mathrm{Fe} 1.8 \%, \mathrm{~S} 2.0 \%$.

| Rock leachate OREAS991 | 1.04 |

## Model S1. Model of gold binding to surface

Gold species of type $k$ ( $k=$ ions or NPs) bind to the surface in such a way, that each species covers a square area of

$$
\begin{equation*}
A_{1, k}=D_{1, k}^{2} \tag{Eq.1}
\end{equation*}
$$

where $D_{1, k}$ is the diameter of the species (Supplementary figure 1 ).

Gold Ions

Gold NPs

Figure S1. Distribution of gold ions and NPs on the surface.

If there is sufficient free surface available, all gold species in the incubation volume, $V_{i n c}$, are assumed to be bound to the surface, covering an area of
$A_{k}=N_{k}^{\prime} A_{1, k}=N_{k}^{\prime} D_{1, k}^{2}$,
where $N^{\prime} k$ is the number of gold species $k$ in the incubation volume. The number of gold species per volume is given by
$N_{k}=\frac{N_{k}^{\prime}}{V_{i n c}}=\frac{\frac{m_{k}}{m_{1, k}}}{V_{i n c}}$,
where $m_{k}$ is the mass of gold in $V_{i n c}$ and $m_{1, k}$ is the mass if a single gold species. Assuming the density of the gold solutions is $1 \mathrm{~g} / \mathrm{cm}^{3}, m_{k}$ is given by the known weight ratio of the solutions, e.g. 1 ppm gold is $1 \mu \mathrm{~g}$ gold in 1 mL incubation volume, i.e. 1 ppm gold equals $m k=1 \mu \mathrm{~g}$ for our incubation method using 1 mL incubation volume. Note that the assumption that all gold species in the incubation volume bind to the surface makes the mass of gold in the incubation volume equal to the mass of gold on the surface area, $A_{s,}$ provided there is sufficient surface area available. Using $N_{k}, A_{k}$ is

$$
\begin{equation*}
A_{k}=N_{k} V_{i n c} A_{1, k} \tag{Eq.4}
\end{equation*}
$$

The surface coverage is defined as

$$
\begin{equation*}
C_{k}=\frac{A_{k}}{A_{s}} . \tag{Eq.5}
\end{equation*}
$$

where $A_{s}$ is the substrate area, which is $4 \mathrm{~cm}^{2}$ for our experiments. Using Eqs. 2-4, $C_{k}$ is calculated by

$$
\begin{equation*}
C_{k}=\frac{m_{k}}{m_{1, k}} \frac{D_{1, k}^{2}}{A_{s}} . \tag{Eq.6}
\end{equation*}
$$

Gold ions:

The mass of a single gold ion, $m_{1, i o n}$, is calculated from the molar mass of gold, $M_{A u}$, and the Avogadro number, $N_{A}$, by
$m_{1, i o n}=\frac{M_{A u}}{N_{A}}$.

The diameter of the gold ions on the surface is defined as the distance of gold ions in bulk gold crystal, allowing to use bulk gold density $\rho_{A u}$, for calculation of gold ion diameter and volume of gold ions on the surface by
$\rho_{A u}=\frac{m_{A u}}{V_{A u}}=\frac{m_{1, \text { ion }}}{V_{1, i o n}}$,
where $V_{1, \text { ion }}$ is the volume of a single gold ion, given by

$$
\begin{equation*}
V_{1, \text { ion }}=\frac{\pi}{6} D_{1, i o n}^{3} \tag{Eq.9}
\end{equation*}
$$

leading to

$$
\begin{equation*}
D_{1, i o n}=\left(\frac{6 M_{A u}}{\pi N_{A} \rho_{A u}}\right)^{\frac{1}{3}} \tag{Eq.10}
\end{equation*}
$$

Using $\rho_{A u}=19.3 \mathrm{~g} / \mathrm{cm}^{3}, M_{A u}=196.967 \mathrm{~g} / \mathrm{mol}, N_{A}=6.022 \times 10^{23} / \mathrm{mol}, D_{1, i o n}$ is calculated to be 0.319 nm . This value is close to gold atom diameter (van der Waals) of $2^{*} 0.166 \mathrm{~nm}=0.332 \mathrm{~nm}^{1}$.

Using Eqs. 8 and 9 and $k=$ ion, $C_{k}$ of Eq. 6 can be rewritten as

$$
\begin{equation*}
C_{i o n}=\frac{m_{i o n}}{\rho_{A u}} \frac{\frac{6}{\pi}}{\frac{D_{1, i o n}}{A_{s}}} . \tag{Eq.11}
\end{equation*}
$$

Eq. 11 can be used to calculate the surface coverage from known mass of gold, $m_{i o n}$, in the incubation volume (e.g. 1 ppm gold equals $m_{i o n}=1 \mu \mathrm{~g}$ gold in 1 mL incubation volume), known gold density, calculated gold ion diameter (Eq. 10) and known substrate area.

Gold NPs:

As the diameter of gold NPs is known, the volume of a single NP, $V_{1, N P}$, can be readily calculated as

$$
\begin{equation*}
V_{1, N P}=\frac{\pi}{6} D_{1, N P}^{3} \tag{Eq.12}
\end{equation*}
$$

Assuming that the gold NPs have the same density as bulk gold, the mass of a single NP, $m_{1, N P}$, is calculated
$m_{1, N P}=\rho_{A u} V_{1, N P}=\rho_{A u} \frac{\pi}{6} D_{1, N P}^{3}$.

Using Eqs. 12 and 13, $C_{k}$ of Eq. 6 is rewritten as
$C_{N P}=\frac{m_{N P}}{\rho_{A u}} \frac{\frac{6}{\pi}}{\frac{D_{1, N P}}{A_{s}}}$.

Similar to gold ions, Eq. 14 can be used to calculate the surface coverage from known mass of gold in the incubation volume (e.g. 1 ppm gold equals $1 \mu \mathrm{~g}$ gold in 1 mL incubation volume), known gold density, known gold NP diameter (Eq. 16) and known substrate area.

## Comparison of gold ions and NPs at fixed surface coverage

Using Eqs. 3 and 6, the surface coverage can be expressed in terms of number of gold species on the surface

$$
\begin{equation*}
C_{k}=N_{k} V_{i n c} \frac{D_{1, k}^{2}}{A_{s}} \tag{Eq.15}
\end{equation*}
$$

This equation enables to calculate the number ratio of gold NPs to gold ions for the same surface coverage (and the same incubation volume)
for $C_{N P}=C_{i o n}$
$\frac{N_{N P}}{N_{\text {ion }}}=\frac{D_{1, i o n}^{2}}{D_{N P}^{2}}=\left(\frac{50 \mathrm{~nm}}{0.319 \mathrm{~nm}}\right)^{2} \sim 25000$.

This ratio shows that, for the same surface coverage, the number of gold NPs on the surface is considerably lower than that of gold ions. Specifically, the ratio scales inversely with the square of the corresponding diameter ratio, i.e. the number of gold NPs on surface is $\sim 25,000$ times lower compared with gold ions.

The LIBS signal is proportional to the volume of gold on the surface. The volume is proportional to the mass of gold via the gold density

$$
\begin{equation*}
V_{k}=\frac{m_{k}}{\rho_{A u}} . \tag{Eq.17}
\end{equation*}
$$

Equations 11 and 14 express the surface coverage in terms of mass of gold on the surface and the diameter of the corresponding gold species. Using these equations and Eq. 17, the volume ratio of gold NPs to ions bound to the surface for the same coverage can be calculated
for $C_{N P}=C_{\text {ion }}$
$\frac{V_{N P}}{V_{\text {ion }}}=\frac{D_{1, N P}}{D_{1, i o n}}=\frac{50 \mathrm{~nm}}{0.319 \mathrm{~nm}}=156.9$.

This ratio shows that the volume ratio and thus LIBS signal scales with the diameter ratio.
Considering that the volume of gold on the surface equals the number of gold species on the surface multiplied with the volume of a single species,
$V_{k}=N_{k} V_{1, k}$,
the volume ratio scaling factor is the result of the number of species on the surface scaling with the inverse of the square of diameter ratio, whereas the volume ratio of the single gold species scales directly with the cubic of the diameter ratio.

## Surface coverage as a function of gold content in incubation solution

Using Eqs. 11 and 14, and known gold weight ratio of the incubation solutions (which equals mion or $m_{N P}$ in incubation volume), the surface coverage for different gold concentration of the incubation solutions can be calculated.

Table S4. Calculated surface coverage for gold ions and gold NPs in solutions at different gold concentration used for incubation. Coverage of 1 indicates that the substrate surface is completely covered with gold ions or NPs.

| gold concentration in solutions used for <br> incubation (gold mass in 1mL incubation <br> volume $)$ | calculated surface coverage |  |
| :--- | :--- | :--- |
|  | for gold ions | for gold NPs |
| $0.16 \mathrm{ppm} \quad(0.16 \mu \mathrm{~g})$ | 0.1 | 0.001 |
| 1 ppm | 0.8 | 0.005 |
| $15 \mathrm{ppm}(15 \mu \mathrm{~g})$ | 11.6 | 0.074 |
| $30 \mathrm{ppm}(30 \mu \mathrm{~g})$ | 23.3 | 0.148 |
