Figure S1. (a) Optical microscopic image of the parabolic shaped PS coated SMF. (b) Spectral response of the corresponding sensor. (c) Optical microscopic image and (d) the reflection spectra of the sensor containing air bubbles.

Figure S2. Change in reflection optical intensity of the sensor as a function of temperature. (a) Reference SMF and (b) PS coated sensor (8.0 μm).

Figure S3. The reflection spectra of PS-coated SMF temperature sensors with a thickness of 2.0 μm (a-b), 4.1 μm (c-d) and 8.0 μm (e-f). A red shift in the wavelength occurs with increasing temperature, while a blue shift in the wavelength occurs with decreasing temperature. The reflection spectra were obtained by increasing the temperature in 5 $^{\circ}\text{C}$ intervals.
