^a Inh% assays were performed at compounds concentration of 200 μM.
^b No – not predicted to be active SIRT2 inhibitor; Yes – Predicted to be active SIRT2 inhibitor. For definition of “active” class see the Manuscript.
^c The predicted probability for “active” class prediction could be between 0 and 1. If between 0.4 – 0.6, it is considered outside applicability domain (AD).
* Compound tested at 100 μM due to assay interference.
† The compound structure is available upon request since synthesis is yet to be published.

Supplementary Note S1 – Internal validation parameters

Following formula were used for calculation of internal validation parameters:

$$R_{int}^2 = 1 - \frac{\sum_{i=1}^{n_{int}} (y_i - \hat{y}_i)^2}{\sum_{i=1}^{n_{int}} (y_i - \bar{y})^2} \quad (1)$$

$$RMSE_{int} = \sqrt{\frac{\sum_{i=1}^{n_{int}} (y_i - \hat{y}_i)^2}{n_{int}}} \quad (2)$$

$$Q^2 = 1 - \frac{\sum_{i=1}^n (y_i - \hat{y}_{i/i})^2}{\sum_{i=1}^n (y_i - \bar{y})^2} \quad (3)$$

$$RMSE_{CV} = \sqrt{\frac{\sum_{i=1}^n (y_i - \hat{y}_{i/i})^2}{n}} \quad (4)$$

Where y_i represents experimental data values; \hat{y}_i represents predicted data values; $\hat{y}_{i/i}$ response of the i-th object estimated by using a model obtained without using the i-th; n - number of objects.

For binary classification models, Matthews correlation coefficient (MCC) was calculated according to the equation (5):

$$MCC = \frac{(TP \times TN) - (FP \times FN)}{\sqrt{(TP+FP) \times (TP+FN) \times (TN+FP) \times (TN+FN)}} \quad (5)$$

Where TP stands for number of true positive predictions, TN stands for number of true negative predictions, FP stands for number of false positive predictions and FN stands for number of false negative predictions.

Supplementary Note S2 - Supplementary methods

In vitro enzymatic assays for SIRT2. Deacetylation activities of SIRT2 in presence of in-house compounds were determined using previously described protocol for Fluor de Lys fluorometric assays (Enzo Life Sciences, Ann Arbor, MI, USA)[68]. Briefly, the reaction was started by incubating the enzyme (SIRT2) with the reaction mixture of acetylated peptide substrate BioMol KI179 for SIRT2 (0.7 Km: 198 μM for SIRT2), NAD⁺ (0.9 Km: 547 μM for SIRT2), and 5% dimethyl sulfoxide (DMSO) or compounds in 5% final DMSO concentration. Incubation was done at 37 °C, for 1 hour. The developer and nicotinamide (2 mM in histone deacetylase (HDAC) assay buffer in total volume of 50 μl) were added and the incubation was continued for 45 min at 37 °C. The fluorescence was measured using EnVision 2104 Multilabel Reader (PerkinElmer, Waltham, MA, USA) with excitation and emission wavelengths of 370 nm and 460 nm, respectively. All

experiments were performed in triplicates. Compounds were screened on SIRT2 inhibitory activity at 200 μ M to obtain percent of inhibition.
