Six-minute walk test								
Distance walked (m)	0.671**	-0.506**	-0.513**	0.259*	0.567**	-0.142	-0.116	-0.308*

VO_{2max}, maximal oxygen consumption; BMI, body mass index; WC, waist circumference; HR, heart rate; 3MST₂₀, 3-min step test using 20.3-cm step box height; 3MST₃₀, 3-min step test using 30-cm step box height. * p < 0.05; ** P < 0.01.

Table S2. Correlations between the measured VO_{2max} and model-predicted VO_{2max} in the 3-min step test using a 20-cm step height. The prediction equation model was developed using randomly selected two-third of the participants, and their value was compared with that of the non-selected one-third of the participants. The same methods were repeated three times.

A. Model Building Set = Group 1 and 2 (N = 44), Validation Set = Group 3 (N = 22)				
	β	SE	t	p
Constant	89.60	6.29	14.24	0.00
Gender	-11.37	2.12	-5.38	0.00
Age	-0.49	0.09	-5.30	0.00
Weight	-0.19	0.07	-2.96	0.01

	r	Adj. R-square	Predicted VO_{2max}	SEE
	0.89	0.773	37.68 (7.79)	4.21

C. Model Building Set = Group 2 and 3 (N = 44), Validation Set = Group 1 (N = 22)				
	β	SE	t	p
Constant	82.13	7.34	11.19	0.00
Gender	-9.93	2.68	-3.71	0.00
Age	-0.43	0.08	-5.51	0.00
Weight	-0.07	0.08	-0.94	0.35
HRR 30s	-0.13	0.07	-1.97	0.06
	r	Adj. R-square	Predicted VO_{2max}	SEE
	0.85	0.702	37.22 (7.84)	5.01

All participants were randomly divided into three groups (1, 2, or 3). Then data from two of three groups were used to develop prediction equation for VO_{2max} value. This equation was used to validate predicted VO_{2max} value with measured VO_{2max} . Data were analyzed with linear regression. HRR 30s, heart rate recovery at 30 s after cessation.

Table S3. Correlations between the measured VO_{2max} and model-predicted VO_{2max} in the 3-min step test using a 30-cm step height. The prediction equation model was developed using randomly selected two-third of the participants, and their value was compared with that of the non-selected one-third of the participants. The same methods were repeated three times.
