

Supplementary Materials

Table S1: Questions on perceived stress from heat and cold and associated productivity loss and health effects

Do you feel heat (cold) stressed during heat waves (cold spells) when you undertake your agricultural activities in a usual year during the last five years?	1. No, not at all 2. Yes, rarely 3. Sometimes 4. Often 5. Very often
If you felt heat (cold) stressed, did you find yourself, as a consequence, less productive when working on agriculture-related activities?	1. No, not at all 2. Yes, rarely 3. Sometimes 4. Often 5. Very often
Have heat waves/cold spells affected your health and the health of your family in the last five years?	1. Definitely yes 2. Probably yes 3. Probably not 4. Definitely not
If yes , how have heat waves/cold spells affected your and family's health over the last five years?	
Were there days in the last year when you could not work at all in the agricultural field because of extreme heat/cold?	1. Yes 2. No
If yes, how many days were you absent during extreme heat/cold?	
What preventative measures do you currently adopt to avoid heat/cold related stress in the agricultural field?	

Table S2: Results of ordered logit model with the dependent variables being the level of heat stress and cold stress (from 1 very low to 3 very high) by districts

Observations	167	183	167	183

*** p<0.01, ** p<0.05, * p<0.1, Standard errors in parentheses. Reference case(\$): low perceived stress from heat and cold. Note: the number of implemented response measures were in response to either heat waves or cold spells, and the number of working days was during either the summer or winter, in the perceived productivity loss from the heat wave and cold spell models, respectively. The number of perceived events were in relation to either heat waves or cold spells, depending on the model. Numbers of perceived illnesses or symptoms were related to either heat or cold in the perceived productivity loss from the heat wave and cold spell models. Perceived stress medium and perceived stress high were also in response to either heat or cold with reference to low perceived stress in self-reported productivity loss from heat waves and cold spells.
