

Figure S1. LPS with ATP treatment of BV-2 cells did not promote an inflammasome response. BV-2 cells treated with LPS (500 ng/mL) for 3 hours followed by ATP (2.5 mM) for 30 min with or without whole red raspberry polyphenols (10 µg/mL) and urolithin A (10 µM). (A) Protein expression of total supernatants from 6 well plates for caspase-1 and cleaved caspase-1 p20 and (right) total protein stained on the membrane. (B) Gene expression levels measured by RT-qPCR for *Asc*, *Tlr4*, and *Nlrp3*. All values are represented as the mean ± SEM. Treatments with different letters indicate significant differences by one-way ANOVA, $p < 0.05$. RRW = whole red raspberry polyphenols; UroA = urolithin A.

Table S1. Phenolic composition of whole red raspberry extracts.

Phenolic (mg per g Dry Extract)	Whole Red Raspberry (RRW)
Quercetin	2.73 ± 0.02
Myricetin	19.1 ± 0.02
Ellagic acid	66.1 ± 3.92
(+)-Catechin	11.4 ± 1.44
(-)-Epicatechin	75.4 ± 0.31
Anthocyanin	
Cyanidin 3-O-β-d-glucoside	8.73 ± 0.01
Cyanidin 3-O-β-d-glucoside equivalent	39.6 ± 0.04
Total phenolic content (mg of GAE per g)	279.0 ± 31

Values represent the mean ± SD of triplicate tests. Ellagitannin is calculated as ellagic acid after hydrolysis. The Cyanidin-3-sophoroside peak is quantified as Cyanidin 3-O-d-glucoside equivalent. GAE, gallic acid equivalent. Adapted from Rong et al., 2020.
