

Supplementary: Rheology–Microstructure Relationships in Melt-Processed Polylactide/Poly(Vinylidene Fluoride) Blends

Reza Salehiyan, Suprakas Sinha Ray, Florian J. Stadler and Vincent Ojijo

Figure S1. Loss (viscous) moduli $G''(\omega)$ of a (a) neat polymers and (b-d) (70/30), (50/50) and (30/70) PLA/PVDF blends processed for different times as a function of frequency from 0.01 to 100 rad/s at strain amplitude of 0.5% and temperature of 200 °C under nitrogen atmosphere.

Figure S2. Complex viscosities $|\eta^*(\omega)|$ of the (70/30), (50/50) and (30/70) PLA/PVDF blends processed for (a) 5, (b) 7.5 and (c) 10 min as a function of frequency from 0.01 to 100 rad/s at strain amplitude of 0.5% and temperature of 200 °C under nitrogen atmosphere.

Figure S3. Complex viscosity of the neat polymers at strain amplitude of 0.5% and temperature of 200 °C under nitrogen atmosphere. Carreau-Yasuda fitting was utilized to obtain the zero-shear viscosity values required for calculation of viscosity ratio.
