Figure S1. The ¹H NMR spectrum of Azo-hydrazide.

Figure S2. The rheological property change of alginate solution to (**a**) alternative shearing frequency of 10–1000 Hz (strain of 5%) and (**b**) time (frequency of 10 Hz and strain of 5%). (**c**) The rheological properties of Azo-hydrazide and alginate without pre-irradiation, the sample was analyzed by a rheological test with an alternative frequency of 10-1000 Hz and fixed strain of 5%.

Figure S3. (a) The rheological properties of the pre-gel without EDCI and NHS before the irradiation of 450 nm light. (b) The rheological properties of the pre-gel after being irradiated by 450 nm light for 30 min. (c) The rheological properties of the pre-gel with EDCI and NHS after being irradiated by 365 nm light for 30 min. And (d) The rheological properties of the pre-gel with EDCI and NHS after being irradiated by 450 nm light for 30 min. And (d) The rheological properties of the pre-gel with EDCI and NHS after being irradiated by 450 nm light for 30 min. And (d) The rheological properties of the pre-gel with EDCI and NHS after being irradiated by 450 nm light for 30 min. All the samples were analyzed by a time-scan rheological test with a fixed frequency of 10 Hz and strain of 5%.

Figure S4. The pre-gel of Azo-alginate gel merged in ddH2O for (**a**) 0 min and (**b**) 30 min. The Azo-alginate gel merged in ddH2O for (**c**) 0 min and (**d**) 30 min. Scale bar = 2 cm.

Figure S5. The rheological properties of the gel when the molar ratio of linker and alginate carboxyl groups was (**a**) 0, (**b**) 0.1, (**c**) 0.2, (**d**) 0.3, (**e**) 0.4 and (**f**) 0.5.

Figure S6. The rheological property of chemical alginate-based gel after (**a**) 0 min, (**b**) 10 min, (**c**) 20 min, and (**d**) 30 min 450 nm light irradiation.

Figure S7. (**a**) The original rheological property of Azo-alginate gel. And (**b**) the rheological property of Azo-alginate gel after 365 nm light and (**c**) 450 nm light irradiation for 10 min respectively.

Figure S8. (a) The original rheological property of Azo-alginate gel. And (b) the rheological property of Azo-alginate gel after 365 nm light and (c) 450 nm light irradiation for 20 min respectively.

Figure S9. The G' and G'' of Azo-alginate gel before and after splicing. The gel was spliced by the 450 nm light irradiation for 15 min, and was analyzed by a time-scan rheological test with a fixed frequency and strain of 50 Hz and 5% respectively.
