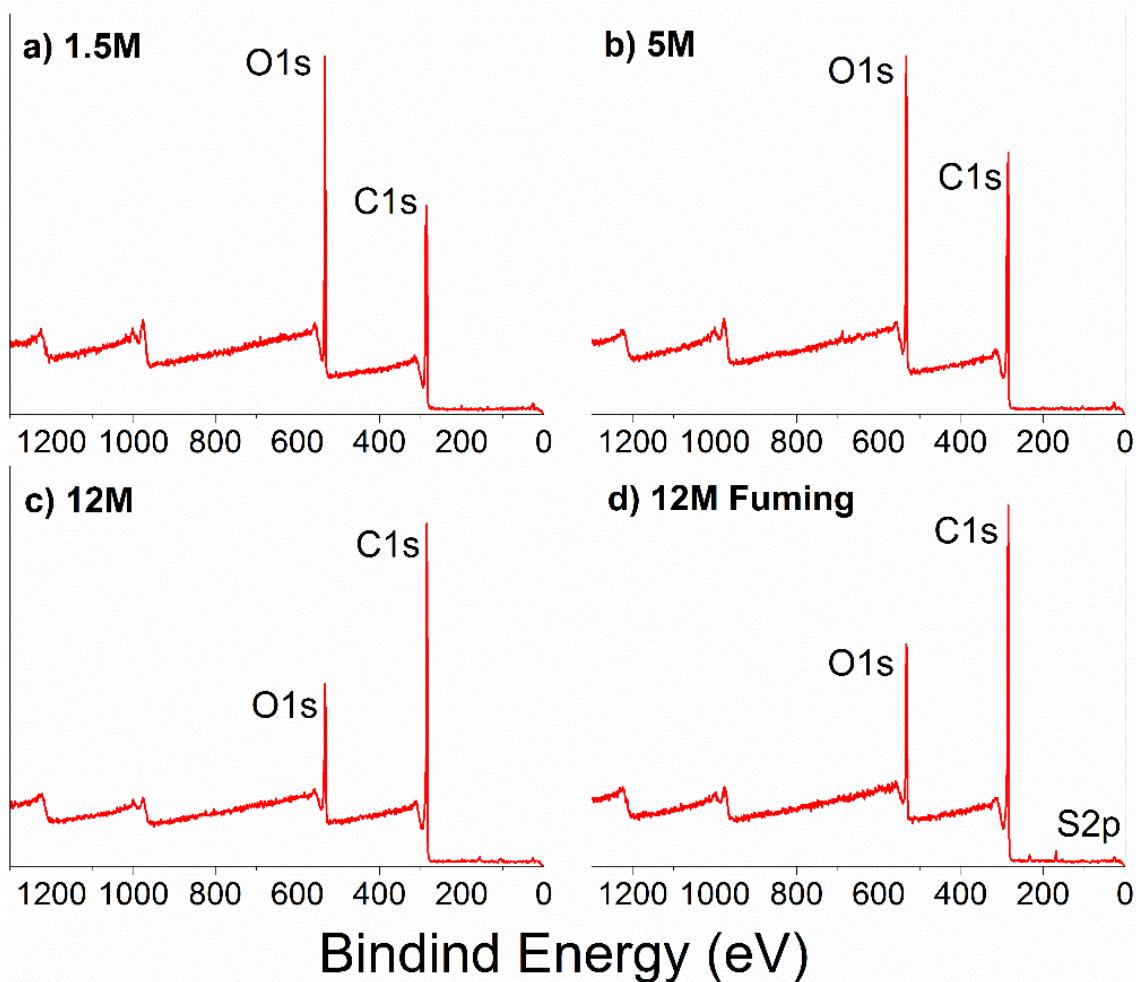

Figure S1. XPS narrow scan of RGO treated with H₂SO₄ at a) 1.5 M, b) 5M, and c) 12 M and fuming H₂SO₄ at d) 12 M. The presence of sulfur it can be observed only in the RGO treated with fuming H₂SO₄ at 12 M, due to the excess of sulfur trioxide (SO₃) in the acid.

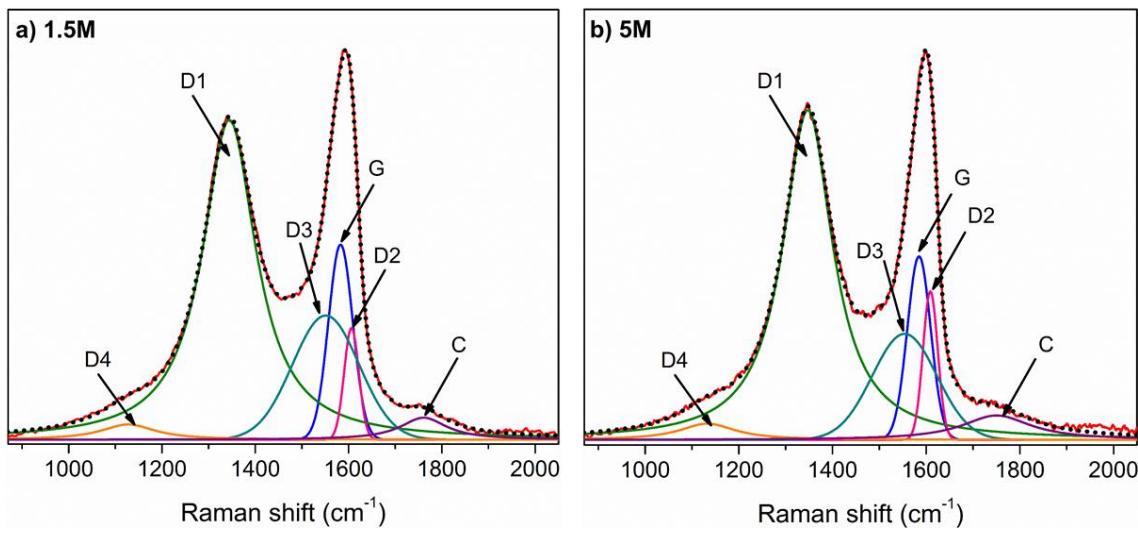

Figure S2. Raman spectroscopy spectra of GO treated with H_2SO_4 in (a) 1.5 M and (b) 5 M concentrations.

Step 1: Protonation of the hydroxyl group.

Step 2: Loss of a water molecule and generation of a carbocation.

Step 3: Formation of a double bond between the carbocation and the neighboring carbon.

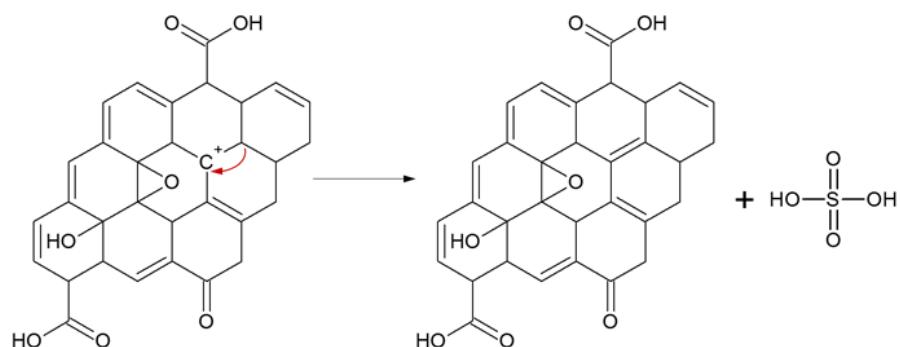

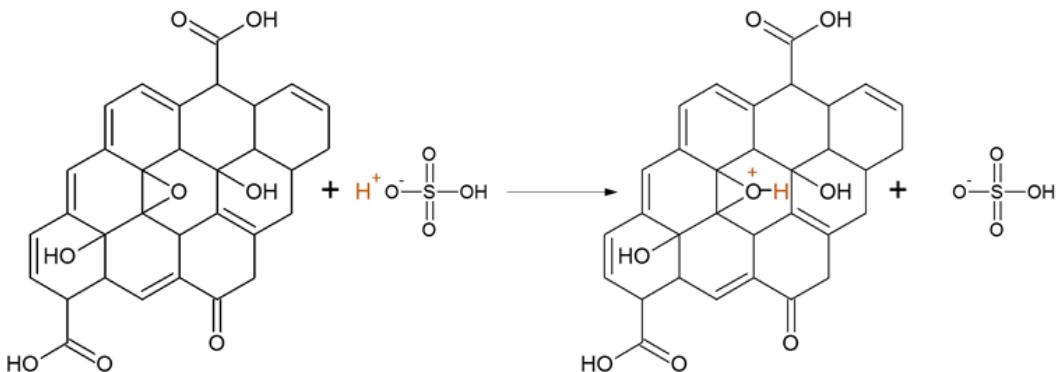

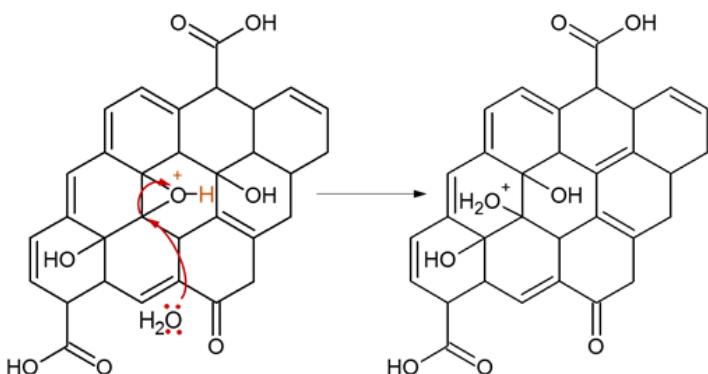

Figure S3. Reduction mechanism of GO by the loss of -OH functional group by the effect of H_2SO_4 .

Step 1: Protonation of the epoxide group.

Step 2: Nucleophilic attack of the water towards one of the carbons.

Step 3: Deprotonation and formation of hydroxyl groups.

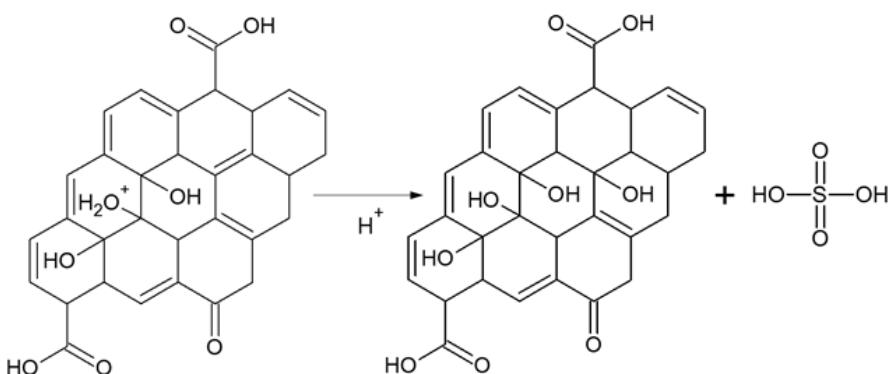

Figure S4. Reduction mechanism of GO by the opening of C-O-C functional group (de-epoxidation) by the effect of H_2SO_4 .
