1. X-ray photoelectron spectroscopy (XPS) results for the core regions of the chalcogenides (S-2p, Se-3d, and Te-3d, respectively).

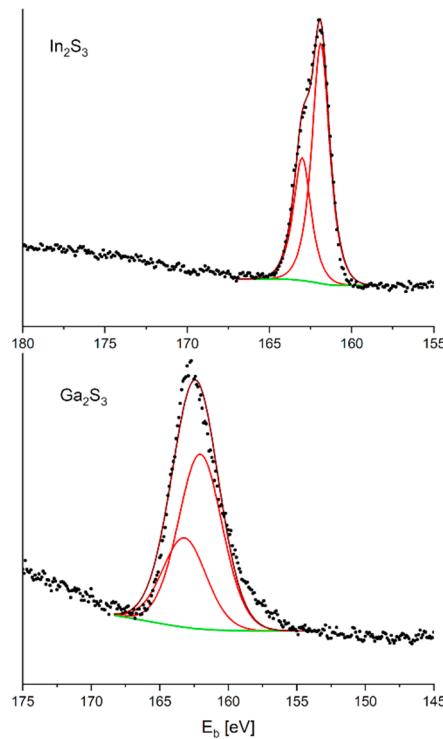

Figure S1. XPS spectrum of the S-2p core region of In_2S_3 (top) and Ga_2S_3 (bottom). Black dots represent the acquired data, the green lines represent the baseline fit, red lines represent the fitted components, the brown lines represent the sum of the fits.

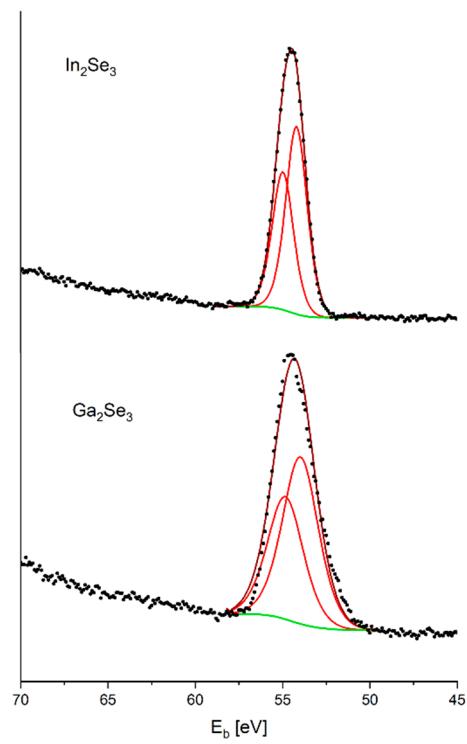

Figure S2. XPS spectrum of the Se-3d core region of In_2Se_3 (top) and Ga_2Se_3 (bottom). Black dots represent the acquired data, the green lines represent the baseline fit, red lines represent the fitted components, the brown lines represent the sum of the fits.

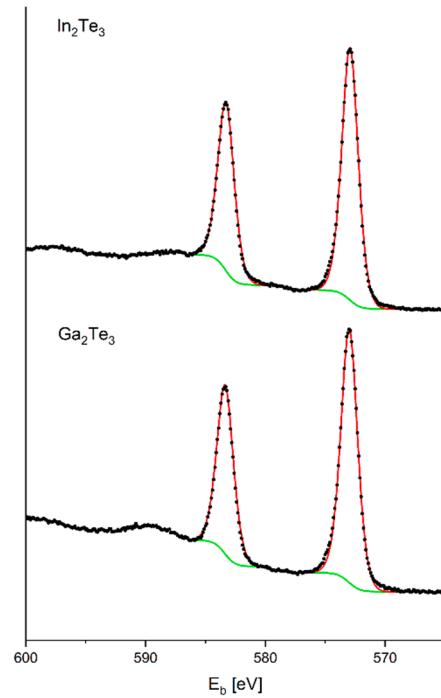

Figure S3. XPS spectrum of the Te-3d core region of In_2Te_3 (top) and Ga_2Te_3 (bottom). Black dots represent the acquired data, the green lines represent the baseline fit, and the red lines represent the fitted components.

2. Auxiliary properties describing the quality of PPMS measurement

Figure S4 shows the sample coupling during PPMS measurements. Sample coupling is a property describing the thermal contact between the sample and the platform. A lower value generally means higher uncertainty of the data. For reliable data, the coupling should be above 90%. This was not the case for In_2Se_3 above 270 K, and those points were therefore not considered in the correlation.

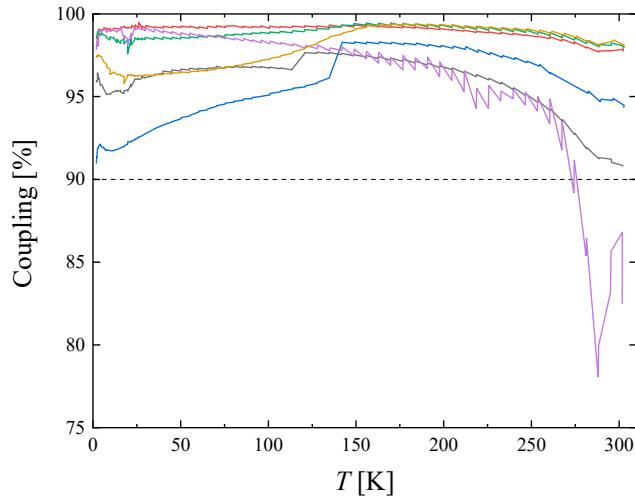

Figure S4. Sample coupling of PPMS samples. Ga_2S_3 (black —), Ga_2Se_3 (red —), Ga_2Te_3 (blue —), In_2S_3 (green —), In_2Se_3 (purple —), In_2Te_3 (olive —).

Figure S5 shows the relative contribution to heat capacity of different parts of the PPMS experimental setup. The lower contribution of the sample also increases uncertainty, and the sample should ideally contribute with at least 50% of the total heat capacity. That is, however, not always possible, especially with samples in copper foil. Bigger samples also usually have lower sample coupling, so a balance between these two factors has to be made.

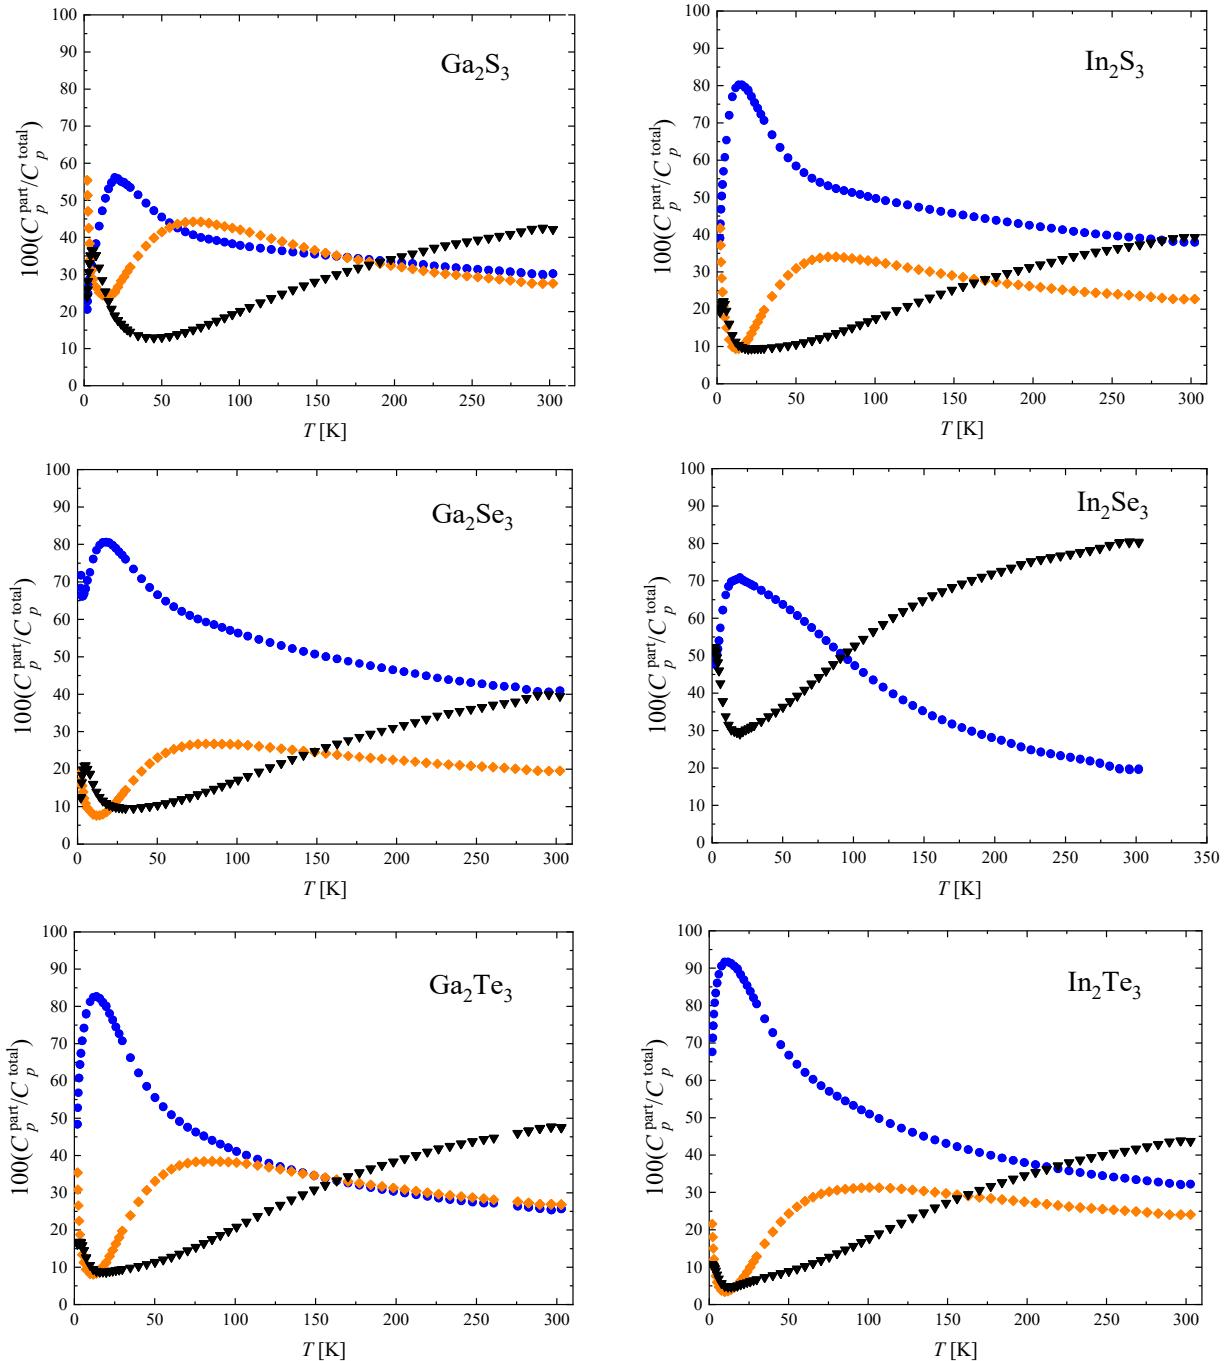

Figure S5. Relative contribution to heat capacity of different parts of the PPMS experimental setup: blue ●, sample; orange ◆, copper; black ▼, addenda.

3. Experimental heat capacities

This section contains experimental heat capacity data obtained in this work by the means of Tian–Calvet calorimetry (apparatus SETARAM μ DSC IIIa), and relaxation calorimetry (apparatus Quantum Design PPMS). Due to their lower accuracy, data obtained using the Quantum Design PPMS were slightly adjusted to agree with results from the more accurate SETARAM μ DSC IIIa, as described in section 2.3 of the main manuscript. These correction factors are shown in the footnote of each table.

Table S1. Experimental heat capacity of Ga_2S_3 (in $\text{J K}^{-1} \text{mol}^{-1}$) obtained using Tian–Calvet calorimetry (SETARAM μ DSC IIIa)^a.

^a Standard uncertainty u is $u(T) = 0.05$ K, and the combined expanded uncertainty of the heat capacity is $U_c(C_{p,m}) = 0.01C_{p,m}$ (0.95 level of confidence). Values are reported with one digit more than is justified by the experimental uncertainty to avoid round-off errors in calculations based on these results.

^b $\delta_{rel} = 100 \times (C_{pm} - C_{pm}^o) / C_{pm}^o$, where heat capacity is calculated by means of Eqs. 1 and 2 with parameters from Table 2 in the main article.

Table S2. Experimental heat capacity of Ga₂S₃ (in J K⁻¹ mol⁻¹) obtained using the relaxation technique (Quantum Design PPMS)^a

^a Standard uncertainty of temperature is $u(T)=0.004 \text{ K}$, and the combined expanded uncertainty of heat capacity $U_c(C_{\text{pm}})$ with 0.95 level of confidence ($k=2$) is $U_c(C_{\text{pm}})=0.1 C_{\text{pm}}$ below 10 K; $U_c(C_{\text{pm}})=0.03 C_{\text{pm}}$ in temperature range 10 to 40 K; $U_c(C_{\text{pm}})=0.02 C_{\text{pm}}$ in temperature range 40 to 300 K. Values are reported with more digits than is justified by the experimental uncertainty to avoid round-off errors in calculations based on these results. Measurements are performed in vacuum (residual pressure $p<10^{-4} \text{ Pa}$). Excluded points are printed in gray. Experimental results from Quantum Design PPMS have been multiplied by a factor of 1.015 to agree with the more accurate SETARAM μ DSC IIIa.

^b $\delta_{\text{rel}} = 100 \times \left(C_{\text{pm}} - C_{\text{pm}}^{\circ} \right) / C_{\text{pm}}^{\circ}$, where heat capacity is calculated by means of Eqs. 1 and 2 with parameters from Table 2 in the main article.

^a Standard uncertainty of temperature is $u(T)=0.004 \text{ K}$, and the combined expanded uncertainty of heat capacity $U_c(C_{\text{pm}})$ with 0.95 level of confidence ($k=2$) is $U_c(C_{\text{pm}})=0.1 C_{\text{pm}}$ below 10 K; $U_c(C_{\text{pm}})=0.03 C_{\text{pm}}$ in temperature range 10 to 40 K; $U_c(C_{\text{pm}})=0.02 C_{\text{pm}}$ in temperature range 40 to 300 K. Values are reported with more digits than is justified by the experimental uncertainty to avoid round-off errors in calculations based on these results. Measurements are performed in vacuum (residual pressure $p<10^{-4} \text{ Pa}$). Excluded points are printed in gray.

^b $\delta_{\text{rel}} = 100 \times \left(C_{\text{pm}} - C_{\text{pm}}^{\circ} \right) / C_{\text{pm}}^{\circ}$, where heat capacity is calculated by means of Eqs. 1 and 2 with parameters from Table 2 in the main article.

Table S5. Experimental heat capacity of Ga_2Te_3 (in $\text{J K}^{-1} \text{mol}^{-1}$) obtained using Tian–Calvet calorimetry (SETARAM μ DSC IIIa)^a.

^a Standard uncertainty u is $u(T) = 0.05 \text{ K}$, and the combined expanded uncertainty of the heat capacity is $U_c(C_{p,m}) = 0.01C_{p,m}$ (0.95 level of confidence). Values are reported with one digit more than is justified by the experimental uncertainty to avoid round-off errors in calculations based on these results.

^b $\delta_{\text{rel}} = 100 \times \left(C_{pm} - C_{pm}^o \right) / C_{pm}^o$, where heat capacity is calculated by means of Eqs. 1 and 2 with parameters from Table 2 in the main article.

Table S10. Experimental heat capacity of In₂Se₃ (in J K⁻¹ mol⁻¹) obtained using the relaxation technique (Quantum Design PPMS)^a.

^a Standard uncertainty of temperature is $u(T)=0.004 \text{ K}$, and the combined expanded uncertainty of heat capacity $U_c(C_{\text{pm}})$ with 0.95 level of confidence ($k=2$) is $U_c(C_{\text{pm}})=0.1 C_{\text{pm}}$ below 10 K; $U_c(C_{\text{pm}})=0.03 C_{\text{pm}}$ in temperature range 10 to 40 K; $U_c(C_{\text{pm}})=0.02 C_{\text{pm}}$ in temperature range 40 to 300 K. Values are reported with more digits than is justified by the experimental uncertainty to avoid round-off errors in calculations based on these results. Measurements are performed in vacuum (residual pressure $p<10^{-4} \text{ Pa}$). Excluded points are printed in gray (see text). Experimental results from Quantum Design PPMS have been multiplied by a factor of 0.988 to agree with the more accurate SETARAM $\mu\text{DSC IIIa}$.

^b $\delta_{\text{rel}} = 100 \times (C_{\text{pm}} - C_{\text{pm}}^{\circ}) / C_{\text{pm}}^{\circ}$, where heat capacity is calculated by means of Eqs. 1 and 2 with parameters from Table 2 in the main article.

4. Tabulated thermodynamic functions

Standard thermodynamic functions were calculated using fundamental thermodynamic relationships (assuming residual entropy at 0 K for all studied sesqui-chalcogenides to be 0 J·K⁻¹·mol⁻¹) and heat capacities $C_{pm}^o(T)$ represented by Eqs 1 and 2 using parameters listed in Table 2:

$$S_m^o(T) = \int_0^T \frac{C_{pm}^o(T)}{T} dT \quad (S1)$$

$$\Delta_0^T H_m^o = \int_0^T C_{pm}^o(T) dT \quad (S2)$$

$$\Delta_0^T G_m^o = \Delta_0^T H_m^o - TS_m^o(T) \quad (S3)$$

^a The combined expanded uncertainty of heat capacity $U_c(C_{pm})$ as well as of all calculated thermodynamic values (with 0.95 level of confidence, $k=2$) is $U_c(X)=0.1 X$ below 10 K; $U_c(X)=0.03 X$ in temperature range 10 to 40 K; $U_c(X)=0.02 X$ in temperature range 40 to 260 K; $U_c(X)=0.01 X$ in temperature range 260 to 350 K, where X represents the heat capacity or the thermodynamic property. Values are reported with one digit more than is justified by the experimental uncertainty to avoid round-off errors in calculations based on these results.

^b Extrapolated values.

^aThe combined expanded uncertainty of heat capacity $U_c(C_{pm})$ as well as of all calculated thermodynamic values (with 0.95 level of confidence, $k=2$) is $U_c(X)=0.1 X$ below 10 K; $U_c(X)=0.03 X$ in temperature range 10 to 40 K; $U_c(X)=0.02 X$ in temperature range 40 to 260 K; $U_c(X)=0.01 X$ in temperature range 260 to 320 K, where X represents the heat capacity or the thermodynamic property. Values are reported with one digit more than is justified by the experimental uncertainty to avoid round-off errors in calculations based on these results.

^bExtrapolated values.
