

Supplementary: Characteristics of the study plots

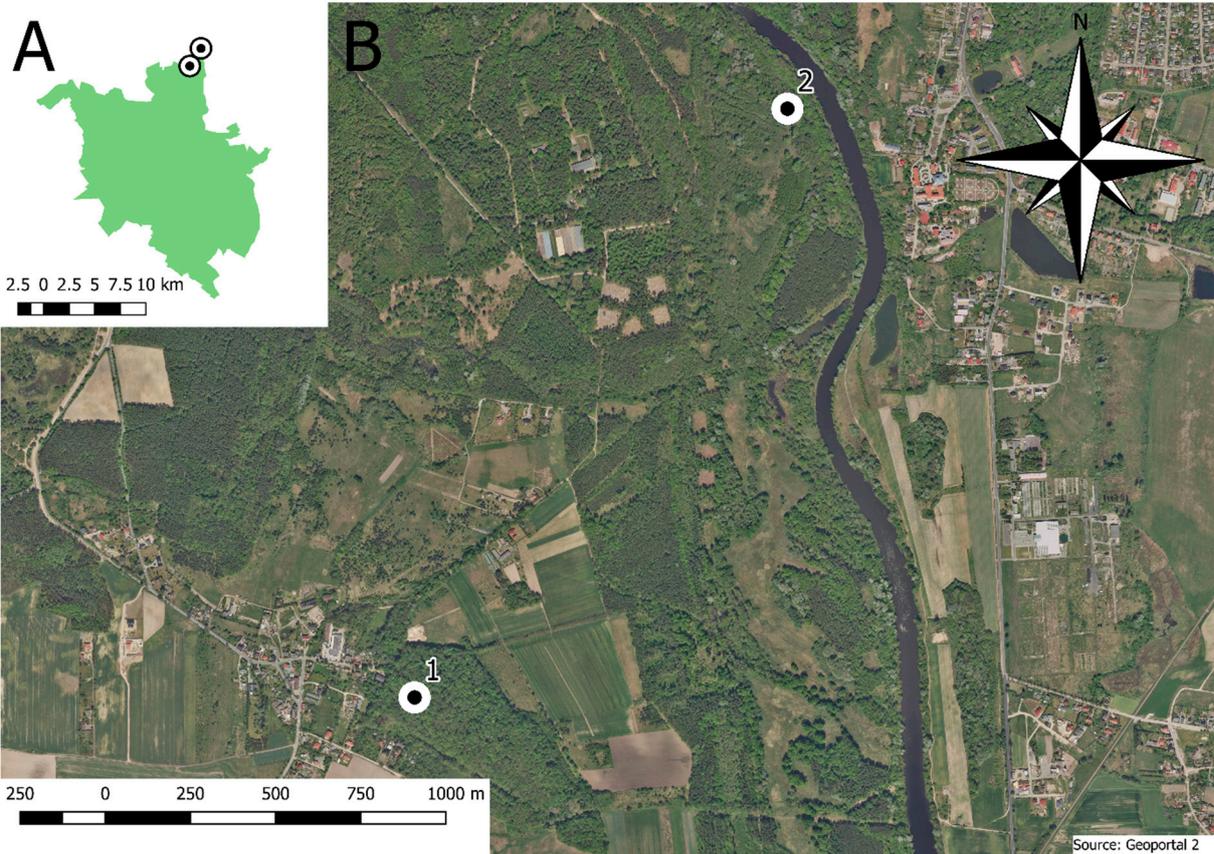

Figure S1. Locality of the study plots: a. locality at the background of satellite imagery, b. locality of study plots at the background of the borders of Poznań city (W Poland; 52°24'N; 16°57'E). Plot no. 1–degraded floodplain forest, plot no. 2–non-degraded floodplain forest.

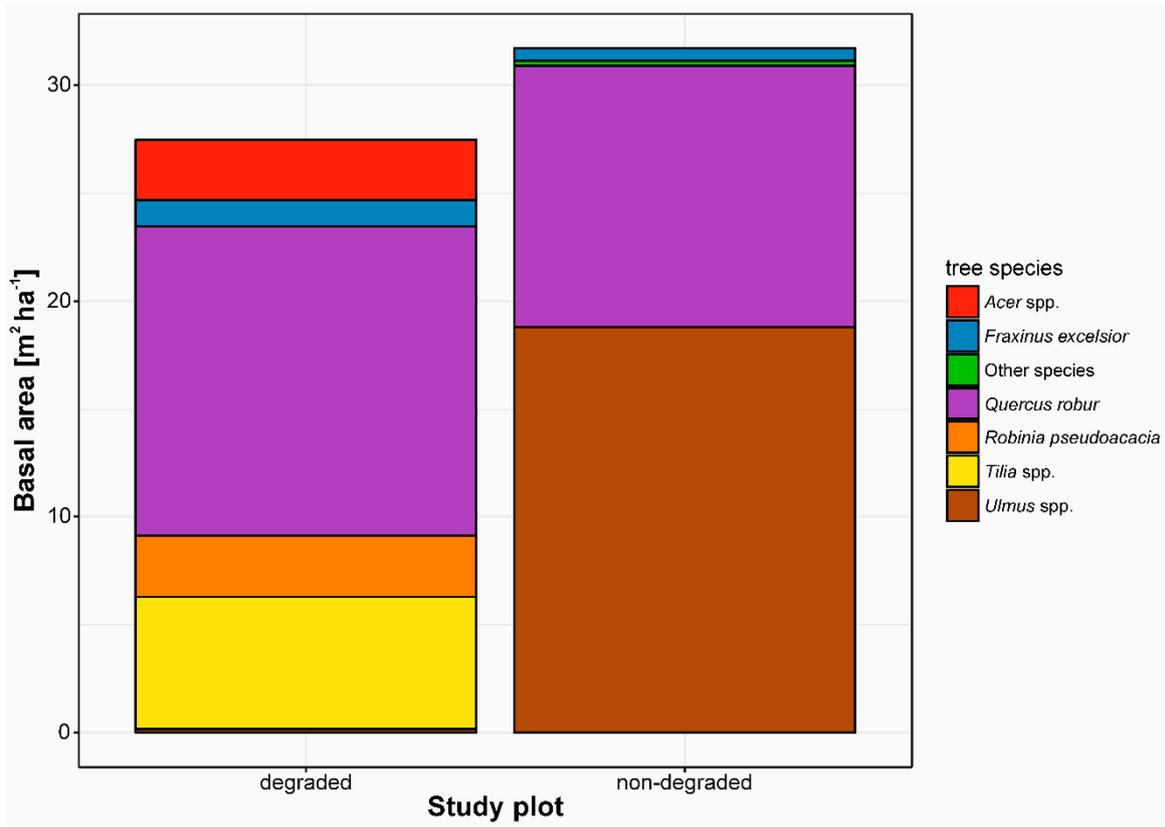

Figure S2. Tree stand species composition–basal area of particular tree species in tree stand layer (trees >7 cm diameter at breast height).

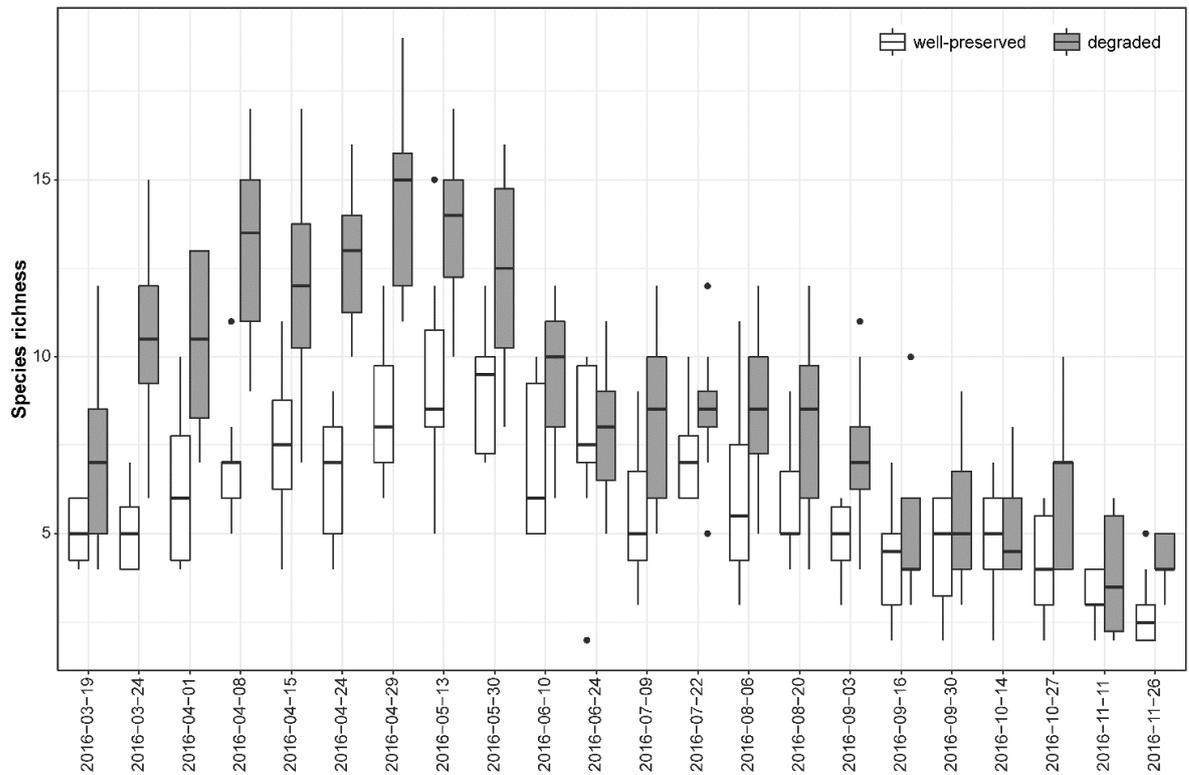

Figure S3. Boxplots representing species richness per sample (10 samples per date). Box represents interquartile range, bar inside box–median, whiskers–range of minimum and maximum excluding outliers (points).

Table S1. Phytosociological table for degraded and non-degraded floodplain forests at two dates and conducted in three 100 m² subplots per study plot. Plant communities represent the *Quercus-Ulmetum minoris* association.

		Degraded			Non-Degraded			Degraded			Non-Degraded

Table S2. Seasonal variation in DIFN among 22 dates and between plots. Differences among terms within each plot were assessed using one-way ANOVA (dates marked with the same letters did not differ statistically significantly at $p = 0.05$). Differences between study plots within the same date were assessed using t -test.

Date	Degraded		Non-Degraded		t	$p (< t)$
