Means +- 95% confidence intervals for five test types and seven treatments on scores from 2011 and 2017. Estimated regression coefficients from a least squares linear regression are also displayed. The regression model predicts scores from 2017 with predictor variables of scores in 2011 and interactive fixed effects of Treatment and Test type. Root mean square error is 1.724.  $R^2$  is 0.779.

**Figure S1.** Decay scores in 2017 were predicted from a mixed-effects regression (conditional on treatment as a random effect;  $R^2 = 0.68$ , RMSE = 2.08).
