

**Table S1.** Shrubs and their basic growth characteristics.

Species	Description
<i>Alangium chinense</i>	Deciduous tree or shrub, 3–5 m tall, found in montane or sparse forests
<i>Cupressus funebris</i>	Coniferous species, fast growing and adaptable, can be used as afforestation species
<i>Rubus coreanus</i>	Shrub, 1–3 m tall, in thickets on mountain slopes or in valleys, riversides, roadsides
<i>Broussonetia papyrifera</i>	Tree, strong, masculine species, extraordinarily adaptable and resistant to adversity
<i>Toona ciliata</i>	A masculine, deep-rooted species that likes warmth and is shade intolerant
<i>Elaeagnus pungens</i>	Evergreen erect shrub, not afraid of sun exposure, also has strong shade tolerance
<i>Zanthoxylum bungeanum</i>	Small deciduous tree, 3–7 m tall, spines on stem often fall early, drought tolerant, sun-loving
<i>Vitex negundo</i>	Shrub or small tree with strong sprouting ability and adaptability
<i>Pyracantha fortuneana</i>	Evergreen shrub or small tree, likes strong light, tolerant of barrenness
<i>Coriaria nepalensis</i>	Shrub, very adaptable, tolerant of drought and infertile conditions
<i>Ligustrum lucidum</i>	Evergreen tree or shrub, water and moisture tolerant, light and shade tolerant
<i>Rhamnus davurica</i>	Adaptable, hardy, drought tolerant, infertile, born in shady and wet places
<i>Myrsine africana</i>	Shrubby plant, grows in sparse forests or forest margins on barren slopes, shade tolerant
<i>Sapium sebiferum</i>	Tree, light-loving species, with certain requirements for light and temperature
<i>Rhus chinensis</i>	Small tree or shrub, light-loving, well-developed root system, fast growth
<i>Vernicia fordii</i>	Deciduous tree, likes warm and humid climates

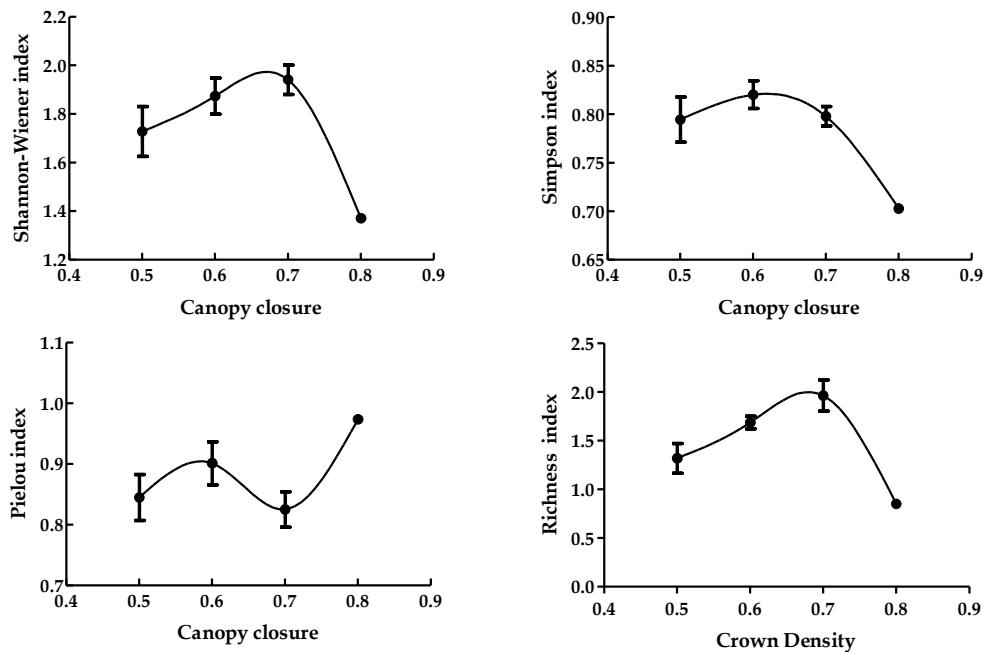

**Table S2.** The niche overlap of shrub populations under different reconstruction patterns.
