

Figure S1: Detection of Norovirus genogroup and Calicivirus VPg protein. VPg proteins that were not detected by mass spectrometry were tagged with a C-terminal Strep-tag II and RAW-Blue cells transfected with 4-5  $\mu$ g of the respective RNA. At 12 hpt cells were harvested, lysed and the protein concentrated on MagStrep "type 3" XT beads. Lysates were probed for the presence of a strep tag by western blotting.
