

Figure S1

Figure S1. Expression pattern confirmation for a random selection of differentially expressed genes from RNA-seq via RT-qPCR. PAMs (n=3) were either infected with PRRSV strain VR-2332 or mock infected and total RNA was collected at 12h, 24h, or 48h and subjected to RT-qPCR. All values are provided as the fold change in PRRSV-infected PAMs relative to mock-infected PAMs.
