2. Antigenic prediction of COVID-19 virus spike protein

3. Supplementary Table S1. Selection of SARS-CoV-2 peptides. Each selected peptide binding to human HLA-I is predicted by using <http://tools.iedb.org/mhci/>, and all alleles are selected and binding of peptide to HLA-II is analyzed using <http://tools.iedb.org/mhcii/>, and peptide length is 15 amino acids against all alleles. Both peptide mixtures with QS21 or Al(OH)₃ induced B and T cell responses in C57BL/6 mice. Furthermore, antibody production against each individual peptide varied with injection time. Using Al(OH)₃ as the adjuvant, the peptide mixtures generated a long-lasting antibody response with an efficacious cellular response. These peptide mixtures, when used as a vaccine, stimulate humoral antibody production, and some peptides could be used to evaluate vaccine effectiveness.

Peptide name and aa sequences	AA position	Binding to MHC-I types	Binding to MHC-II types	Human HLA-II	Human HLA-I
