Figure S1. Impact of Renal Impairment on AUC of Nifedipine in Females. Simulations with increasing oral doses (30 to 180 mg) were administered in a fasted state to an exclusively female population. Simulations included ten trials with ten individuals in each trial. Age ranged from 21 to 65 years, and simulations were conducted with varying the degrees of RI by utilizing the following populations, Sim-Healthy Volunteers, Sim-RenalGFR_30-60, and Sim-RenalGFR_less_30 to represent 100%, 50% and 10% GFR.

Figure S2. Impact of Fraction Unbound on AUC of Nifedipine in Females. Simulations were performed varying fraction unbound (f_u) from the observed value for nifedipine (0.04) to 1.0. A dose of 60 mg was administered orally to an exclusively female population in a fasted state. Simulations included ten trials with ten individuals in each. Age ranged from 21 to 65 years, and simulations were conducted with varying the degrees of RI by utilizing the following populations, Sim-Healthy Volunteers, Sim-RenalGFR_30-60, and Sim-RenalGFR_less_30 to represent 100%, 50% and 10% GFR.

Figure S3. Impact of Competitive Inhibition on AUC of Nifedipine in Females. Simulations were performed incorporating competitive inhibition through the factor R ($[I]/K_i$). R was varied from 0 to 100. A dose of 60 mg was administered orally to an exclusively female population in a fasted state. Simulations included ten trials with ten individuals in each. Age ranged from 21 to 65 years, and simulations were conducted with varying the degrees of RI by utilizing the following populations, Sim-Healthy Volunteers, Sim-RenalGFR_30-60, and Sim-RenalGFR_less_30 to represent 100%, 50% and 10% GFR.
