

Supplementary Materials for

# Metallic Stent Mesh Coated with Silver Nanoparticles Suppresses Stent-Induced Tissue Hyperplasia and Biliary Sludge in the Rabbit Extrahepatic Bile Duct

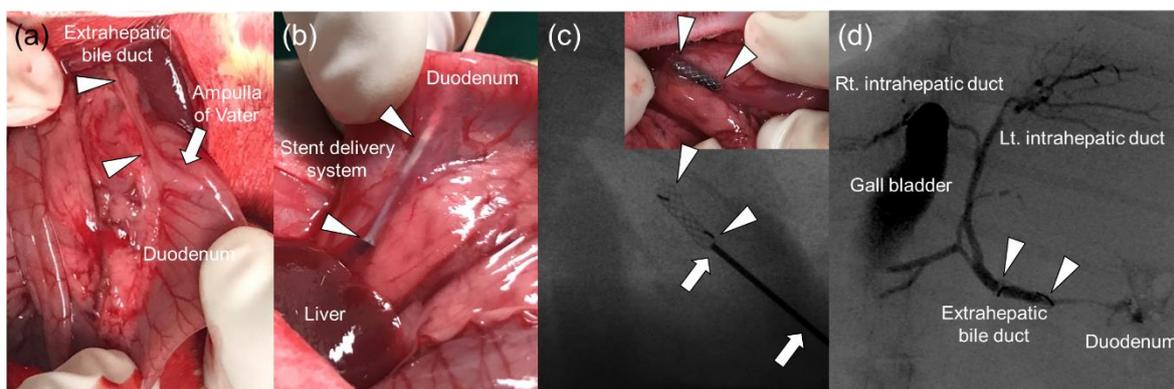

**Table S1.** Characterization of AgNPs-coated SEMS.

Groups	Feed amount		EDS analysis	
	PDA <sup>a</sup> (mg)	AgNO <sub>3</sub> <sup>b</sup> (mg)	Carbon <sup>c</sup> (%)	Ag <sup>d</sup> (%)
<b>A</b>	0	0	7	0
<b>B</b>	15	45	28	22
<b>C</b>	15	90	24	34
<b>D</b>	15	180	20	55

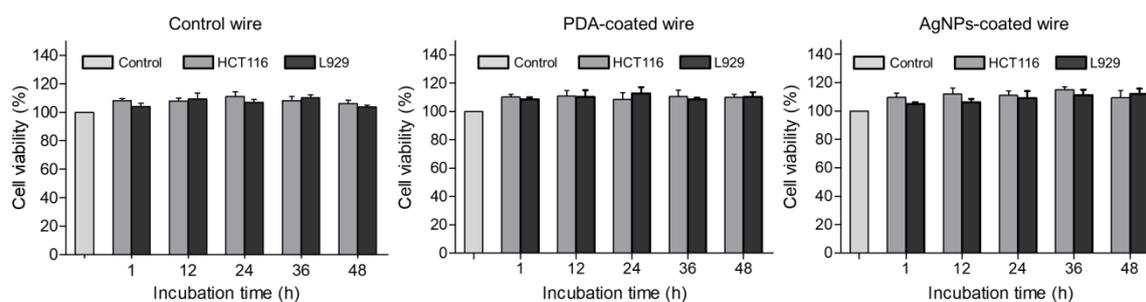

<sup>a</sup> Weight of feed dopamine hydrochloride per SEMS in 15 mL of 5 mM Tris buffer; <sup>b</sup> Weight of feed AgNO<sub>3</sub> per SEMS in 15 mL of DW; <sup>c</sup> Percent of carbon in the total area, as determined by EDS mapping; <sup>d</sup> Percent of Ag in the total area, as determined by EDS mapping; Note. DW; deionized water, PDA; dopamine hydrochloride, SEMS; self-expandable metallic stent.

**Figure S1.** Flow diagram and study design showing the randomization process and follow-up. Note: NZ, New Zealand; SEMS, self-expandable metallic stent; AgNPs, Ag nanoparticles.

**Figure S2.** Photographic and radiographic images showing the technical steps involved in stent placement in the rabbit extrahepatic bile duct. (a) A photograph identifying the ampulla of Vater (arrow), the extrahepatic bile duct (arrowheads), and the duodenum. (b) Photograph obtained during stent placement showing a compressed stent (arrowheads), which was loaded in the angiocatheter and positioned in the extrahepatic bile duct. (c) Photograph and radiograph showing a placed stent (arrowheads) in the rabbit extrahepatic bile duct and a pusher rod (arrows). (d) Post-procedural cholangiography showing good passage of contrast medium through the stent (arrowheads) without any procedure-related complications.

**Figure S3.** Cytotoxicity analysis of control nitinol wire, PDA-coated wire, and AgNPs-coated wire after incubation with L929 and 293 cells for different periods of time.
