

Supplementary Materials: Synthesis and Characterization of Hierarchical Zeolites Modified with Polysaccharides and Its Potential Role as a Platform for Drug Delivery

Agata Wawrzyńczak, Izabela Nowak, Natalia Woźniak, Jagoda Chudzińska, and Agnieszka Feliczak-Guzik

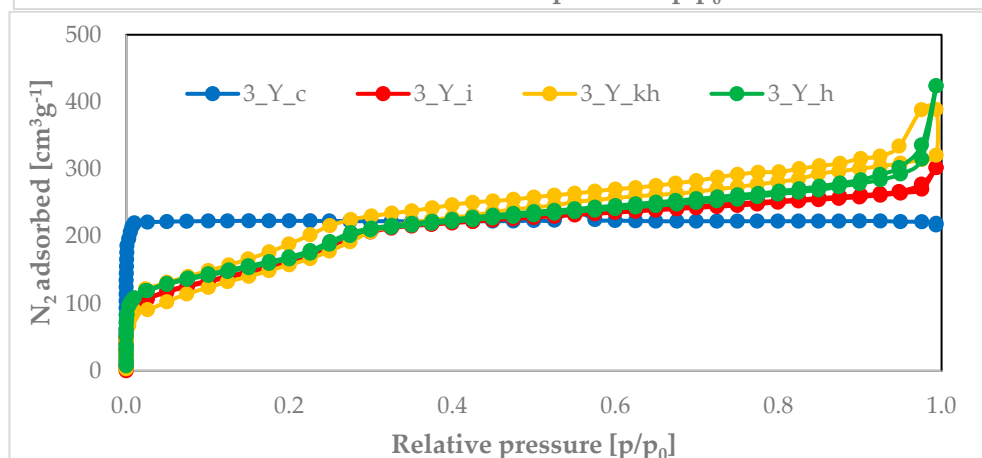

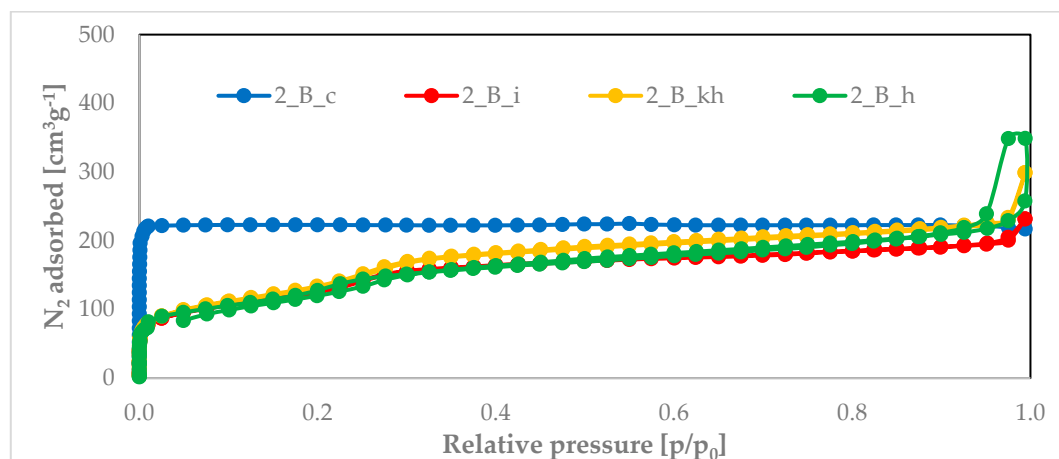

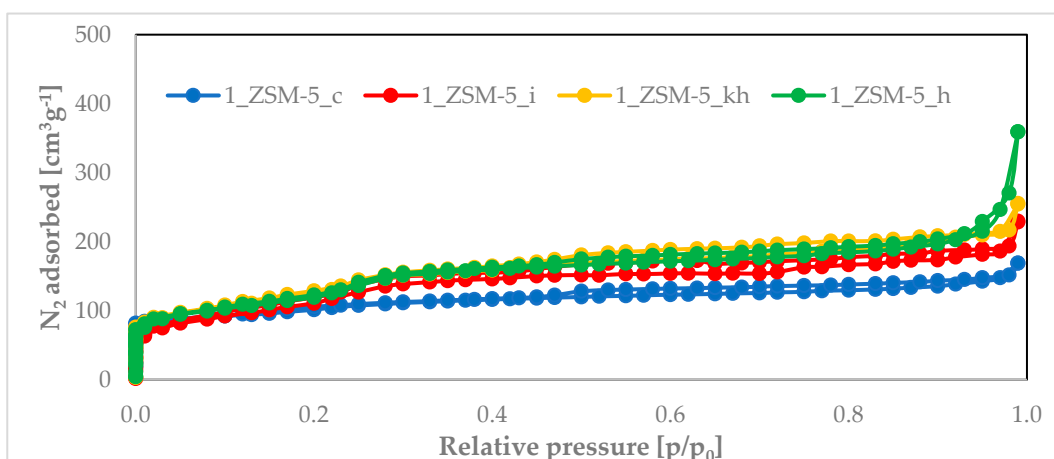

Figure S1. Nitrogen adsorption/desorption isotherms for materials: (A) based on commercial zeolite of ZSM-5 type (1_ZSM-5_c – commercial zeolite, 1_ZSM-5_i – inulin modified material, 1_ZSM-5_kh - hyaluronic acid modified material, 1_ZSM-5_h - heparin modified material); (B) based on commercial zeolite of BEA type (2_B_c –

commercial zeolite, 2_B_i – inulin modified material, 2_B_kh – hyaluronic acid modified material, 2_B_h – heparin modified material); (C) based on commercial zeolite of FAU type (3_Y_c – commercial zeolite, 3_Y_i – inulin modified material, 3_Y_kh – hyaluronic acid modified material, 3_Y_h – heparin modified material).
