Supplementary Information

Figure. S1. ^1H -NMR peaks of $\gamma\text{CD}-(\text{DEAP}_{3.4}/\text{HA}_{2.1})$.

Figure. S2. ¹H-NMR peaks of γ CD-(PA_{4.2}/HA_{2.0}).

Figure. S3. ¹H-NMR peaks of γ CD-(PA_{4.2}).

Figure. S4. FE-SEM images of $\gamma\text{CD}-(\text{DEAP}_{7.2}/\text{HA}_{2.1})$ NPs, $\gamma\text{CD}-(\text{DEAP}_{3.4}/\text{HA}_{2.1})$ NPs, $\gamma\text{CD}-(\text{PA}_{4.2}/\text{HA}_{2.0})$ NPs, and $\gamma\text{CD}-(\text{PA}_{4.2})$ NPs at pH 7.4 and 6.5 **(a)** without laser irradiation and **(b)** under laser irradiation at a light intensity of 1 W/cm² for 10 min.

Figure. S5. Mitochondrial membrane hyperpolarization of MCF-7 or BT-474 cells treated with (PTX/FeCO) γ CD-(DEAP_{7.2}/HA_{2.1}) NPs. In brief, the MCF-7 or BT-474 tumor cells were incubated with (PTX/FeCO) γ CD-(DEAP_{7.2}/HA_{2.1}) NPs, with an equivalent FeCO concentration of 6.75 $\mu\text{g/mL}$, at 37 $^{\circ}\text{C}$ for 4 h. Subsequently, the cells were washed with fresh PBS (pH 7.4) and exposed to 808 nm irradiation at a power density of 0.5 W/cm^2 for 10 min. Afterward, the resulting cells (1×10^6 cells) were treated with 1,1',3,3'-tetraethyl-5,5',6,6'-tetrachloroimidacarbocyanine iodide (JC-1) at a concentration of 0.25 $\mu\text{g/mL}$ for 20 min. The cells were then examined using a fluorescence microscope to analyze the mitochondrial membrane hyperpolarization. The JC-1 dye used in this experiment was purchased from Sigma-Aldrich (St. Louis, MO, USA).
