

These supplementary materials (Tables S1–S2 and Figures S1–S2) are adopted from Lee (2018), Ph.D thesis of Yonsei University.

The modified water-table fluctuation (WTF) method based on hydrologic parameters, such as groundwater table fluctuation and cumulative precipitation, was used to calculate the recharge at the five monitoring wells.

$$R = \frac{\Delta h}{\sum P} \times S_y$$

where R is recharge, Δh is the water-level increase, $\sum P$ is the amount of accumulated rainfall and S_y is the specific yield.
