Supplementary Methods

S1 Analysis of plant antioxidants

As for the antioxidants analysis, fresh leaf tissue (2.5 g) was flash-frozen in liquid nitrogen and homogenized in a mortar in 15 mL of 50% (v/v) acidified methanol (0.1 M HCl) extraction medium. The extraction was incubated for 20 min at room temperature and then centrifuged at 9000 g for 30 min. This extracted procedure was performed three times and the supernatants were pooled as a raw extract. The crude extract was dried under a vacuum at 40°C to remove acidified methanol and then rinsed with 100% methanol to a final volume of 10 ml for subsequent antioxidants analysis. Phenolic content in the extracts was determined colorimetrically according to the method suggested by Singleton, Orthofer and Lamuela-Raventós [1]. Shortly, 0.5 mL of the plant extract was mixed thoroughly with H₂O (0.5 mL) and 1M Folin-Ciocalteau reagent (2.0 mL) and incubated at room temperature for 3-5 min after which 10% (w/v) Na₂CO₃ (10 mL) was added to the mixture. Blue color was determined at 725 nm after 30 min of incubation. For phenolic acid determination, extract (1.0 mL) was well-mixed with a mixture combined with distilled water (5.0 mL), 0.5 M HCl (1.0 mL), Arnov reagent (1 mL, 10% (w/v) Na₂MoO₄·2H₂O and 10% (w/v) NaNO₂) and 1 M NaOH (1 mL), followed by adding distilled water to a final volume of 10 mL. Result of phenolic acid content was measured immediately by determination of the optical density (OD) at 590 nm [2]. Total flavonoids analysis was determined as described by Lamaison and Carnat [3]. Briefly, 1.0 mL of extract was reacted with 1.0 mL of 2% (w/v) AlCl₃·6H₂O (in methanol) and incubated at room temperature for 10 min. Total flavonoids content of the extract was calculated by measuring OD at 430 nm. To determine antioxidant activity 80 µL of extract and 1.92 mL of 0.06 mM 1, 1-diphenyl-2-picrylhydrazyl (DPPH) in methanol was mixed and incubated for exactly 2.5 min. The mixture was measured by recording the absorbance at 515 nm [4]. A UV-Vis spectrophotometer (HITACHI, U-2900) was used for the determination of absorbance. Then the absorbance were evaluated against standard curves of gallic acid, caffeic acid, quercetin and trolox for phenolic content, phenolic acid, flavonoids and antioxidant activity, respectively.
