136	<i>Trifolium repens</i>		1		1		
137	<i>Trifolium</i> sp.						1
138	<i>Trisetum flavescens</i> ssp. <i>splendens</i>		1				
139	<i>Valerianaceae</i>						1
140	<i>Vicia cracca</i> ssp. <i>incana</i>					1	
141	<i>Vicia sativa</i> ssp. <i>nigra</i>		1				

1: indicates presence of each plant species in a specific case study region.

Table S2. Formulae of all diversity indices.

A/A	Diversity indices	Formulae
1	Shannon – Wiener	$H' = - \sum p_i \ln p_i$
2	Simpson	$D = \sum p_i^2$
3	Species Number	Species Number (N)
4	Margalef	$D = (S - 1)/\ln N$
5	Equitability	$J = H'/\log (S)$
6	Berger - Parker	$d = N_{max}/N_T$
7	McIntosh	$D = N - U/N - \sqrt{N}$

Diversity index No. 1: where $p_i = N_i/N_T$, N_i is the abundance of the i th species, and N_T is the total abundance; therefore, p_i is the proportion of individuals of i th species. No. 2: where $p_i^2 = N_i(N_i - 1)/N_T(N_T - 1)$, but it is usually calculated as: $p_i^2 = (N_i/N_T)^2$, where N_i is the number of individuals in the i th species and N_T is the total number of individuals in each sample. No. 3: the total species number in integer form. No. 4: where S is the number of recorded species and N is the total number of individuals in the sample. No. 5: where H' is Shannon–Wiener index and S is the number of recorded species. No.

6: where N_{max} is the number of individuals in the most abundant species and N_T is the total number of individuals. No. 7: where N is the total number of individuals in the sample. In addition, U is calculated by the following formula: $U = \sqrt{\sum n_i^2}$, where n_i is the number of individuals of each species.
