

Figure S1. Measurement of canopy reflectance using a multispectral radiometer.

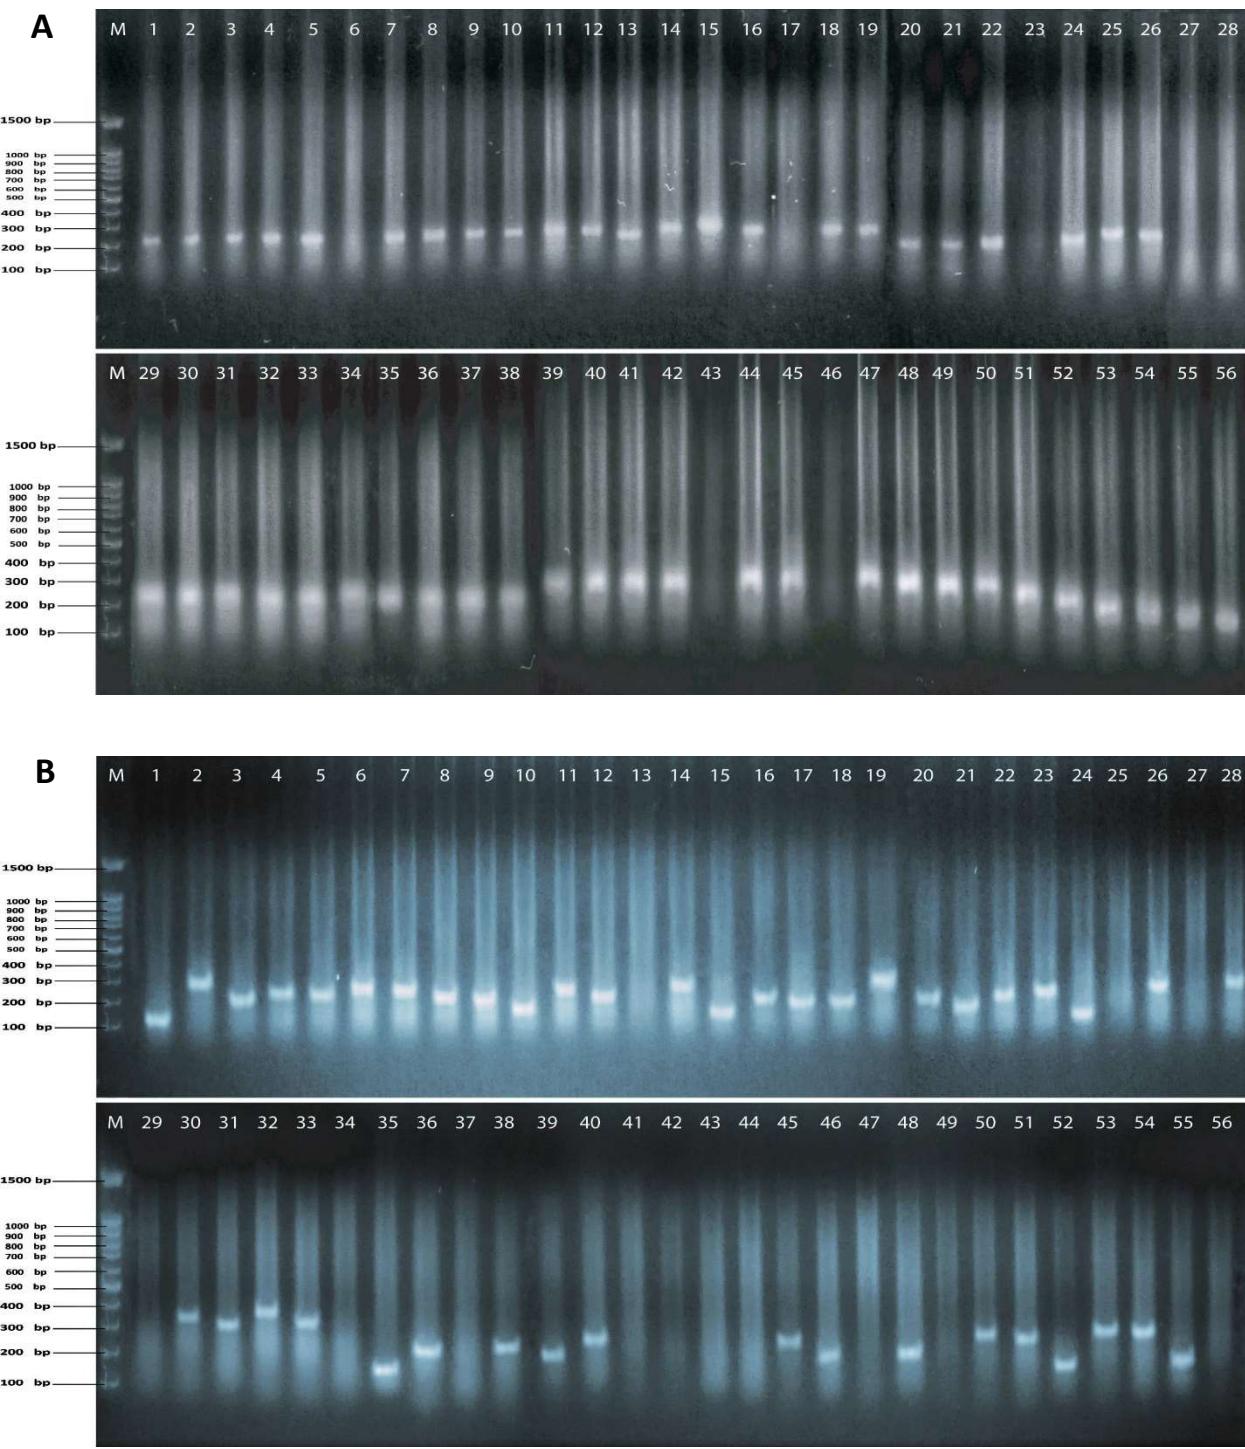

Figure S2. The SSR marker profiles of bread wheat genotypes using *wmc177* (A) and *wms292* (B) SSR primers. M indicates molecular weight. A list of 56 wheat genotypes is present in the supplementary **Table S1**.

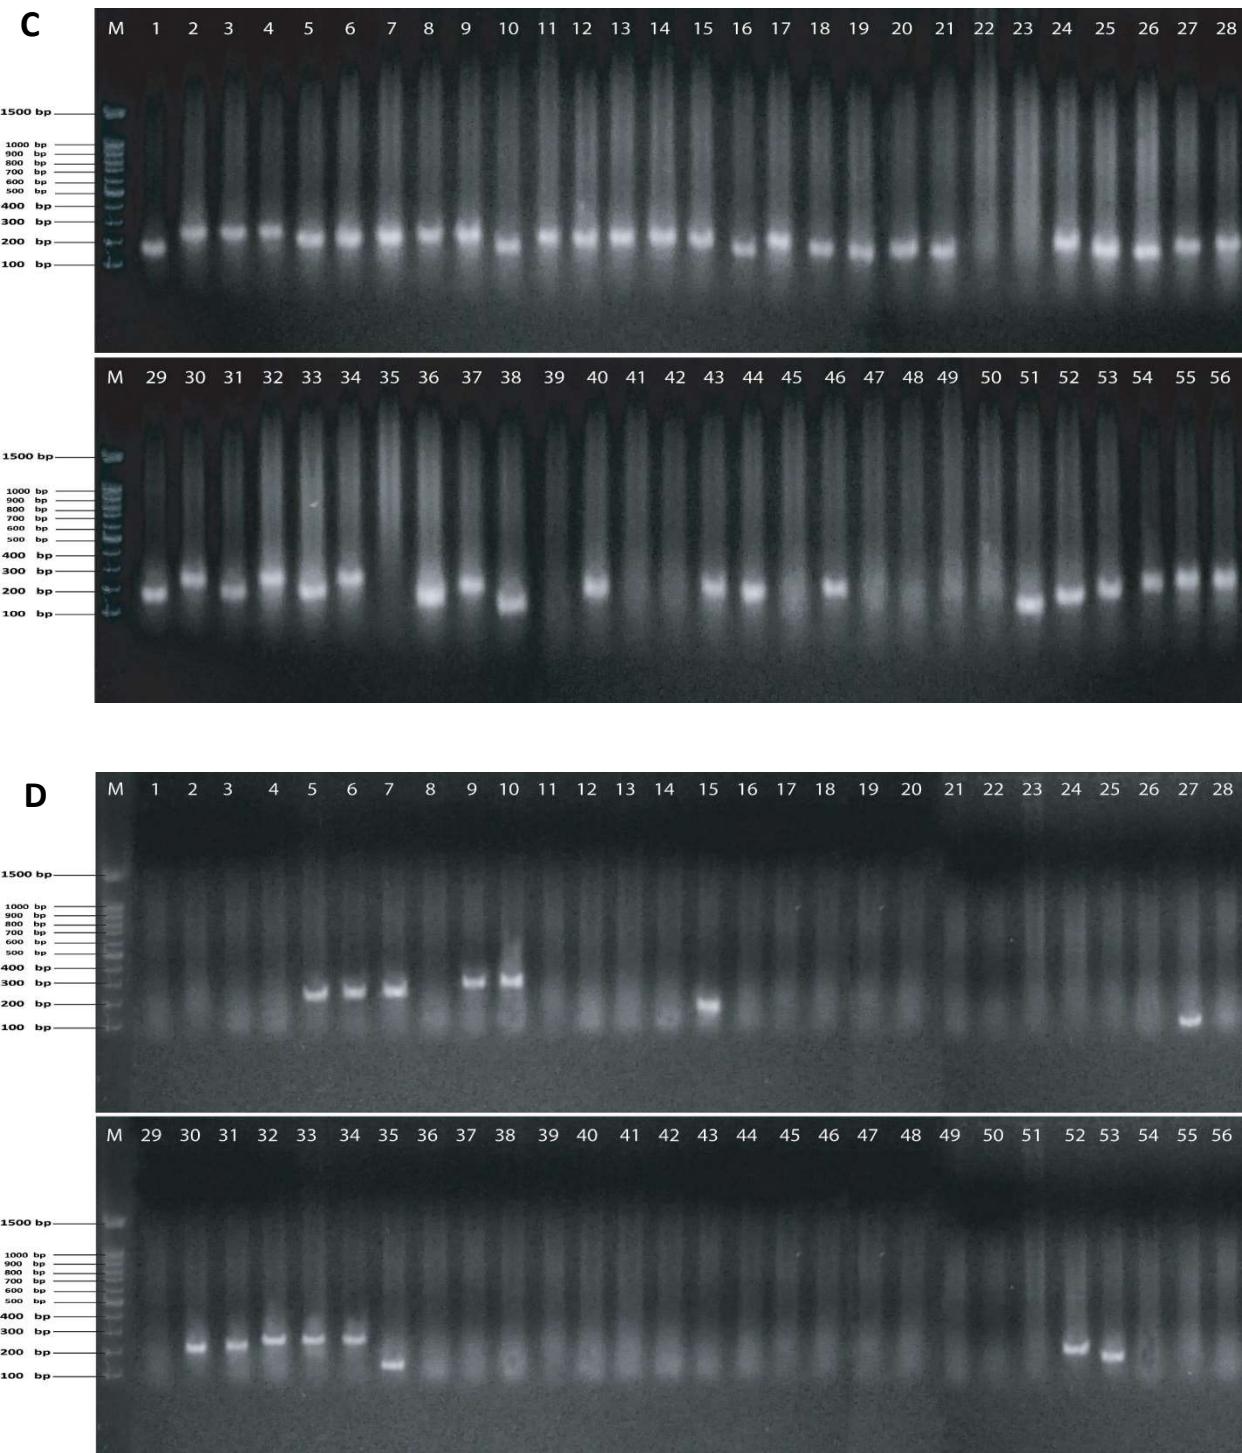

Figure S2 (contd.). The SSR marker profiles of bread wheat genotypes using *wms260* (C) and *wms186* (D) SSR primers. M indicates molecular weight. A list of 56 wheat genotypes is present in the supplementary **Table S1**.

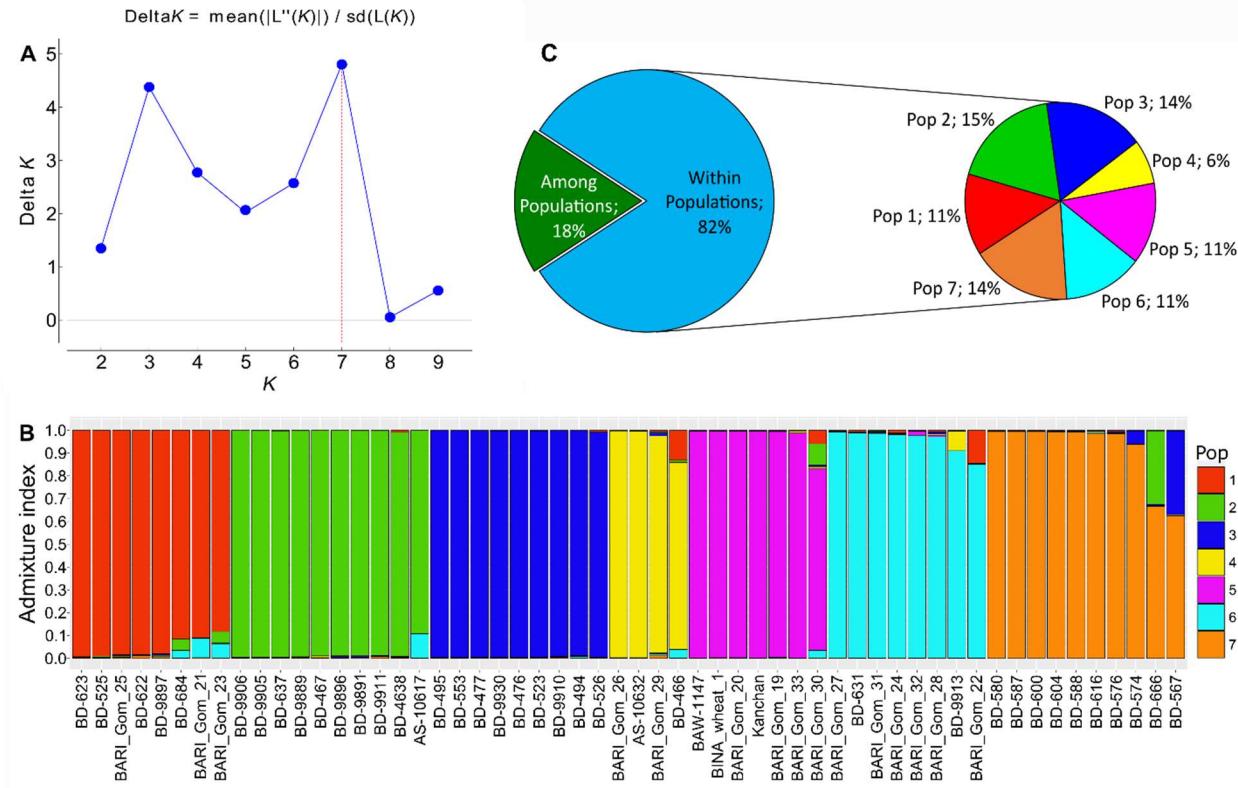

Figure S3. A. The peak of $\Delta K = 7$ determines the number of populations in our study, B. Estimated population structure of 56 bread wheat genotypes with 25 SSR markers for $\Delta K = 7$, and C. The population obtained by the STRUCTURE-based method was used to analyse the molecular variance (AMOVA) of 56 wheat genotypes.

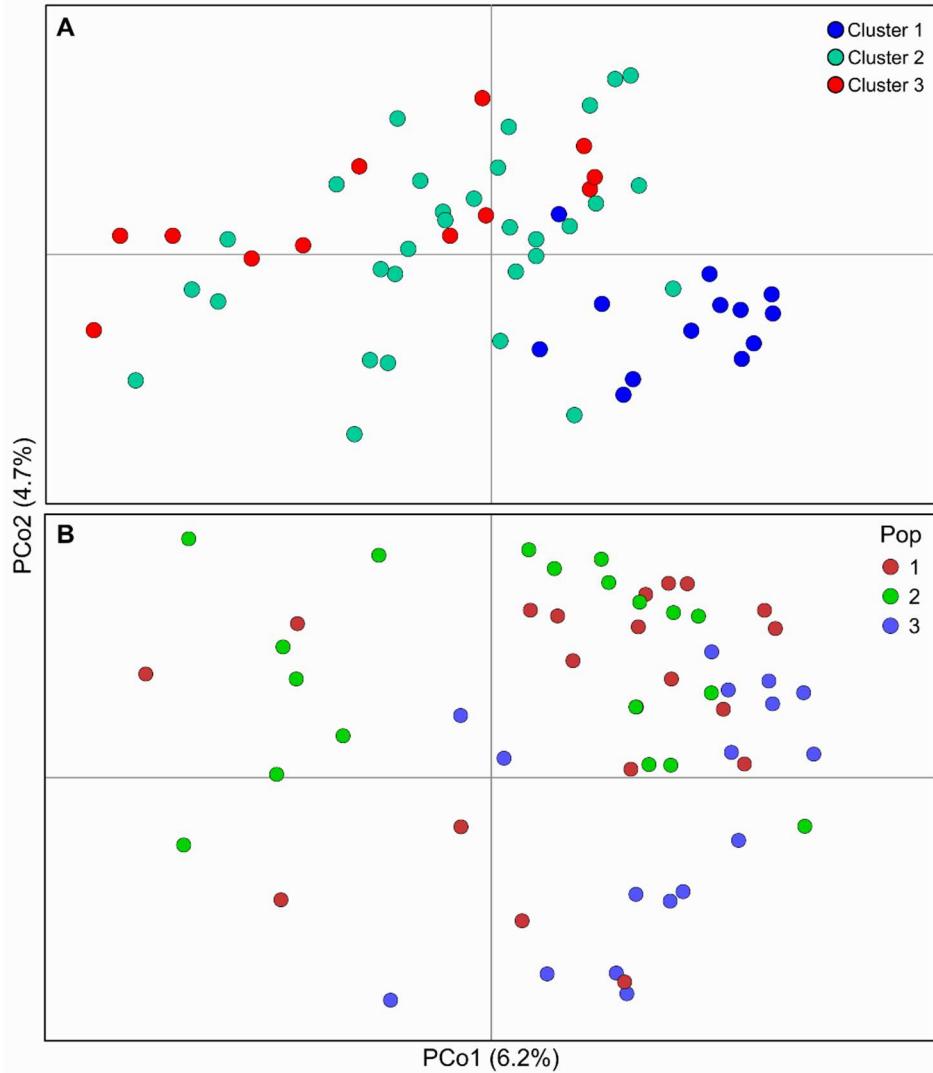

Figure S4. Principal coordinate analysis (PCoA) of SSR marker allelic data for 56 wheat genotypes with respect to phenotypic clusters (A), and model-based subpopulations (B). Individuals, clusters, and populations differences are visualized in the figure. Individuals from different clusters and populations are intermixed across the coordinates.

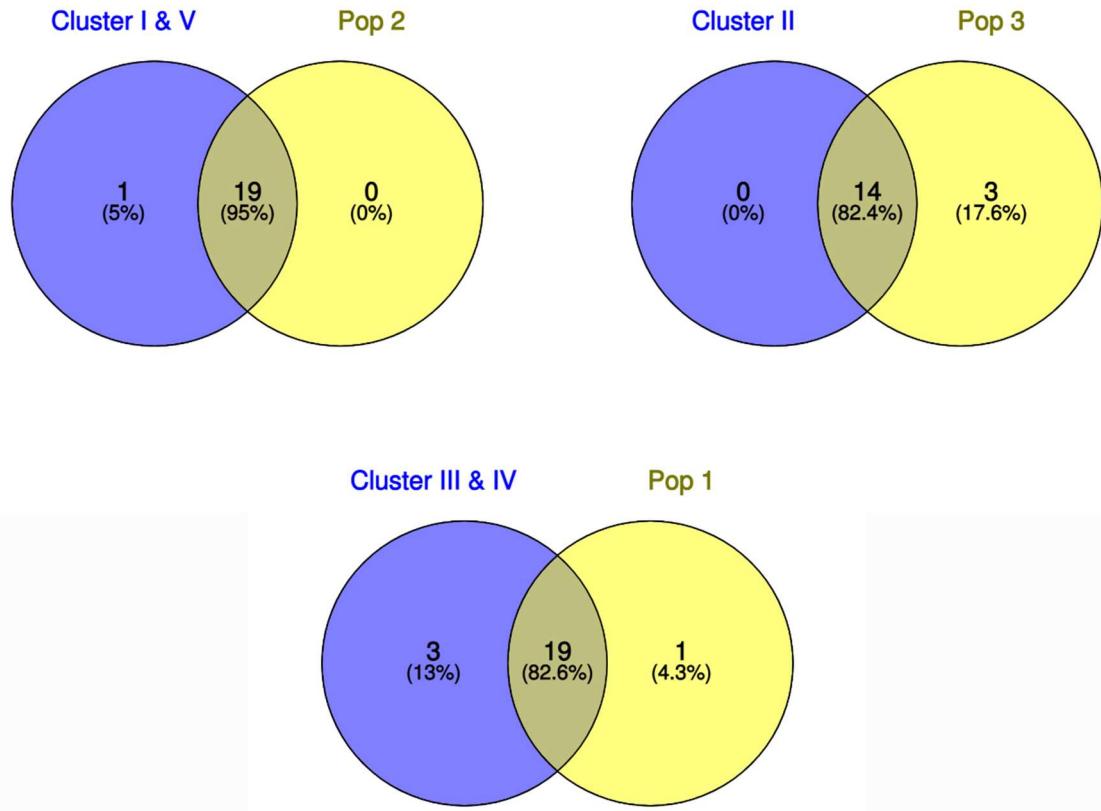

Figure S5. Venn diagram showing co-linearity between SSR-based NJ clusters and model-based populations. Overall, 86.7% co-linearity exists between NJ clusters and extracted model-based populations when $\Delta K = 3$.

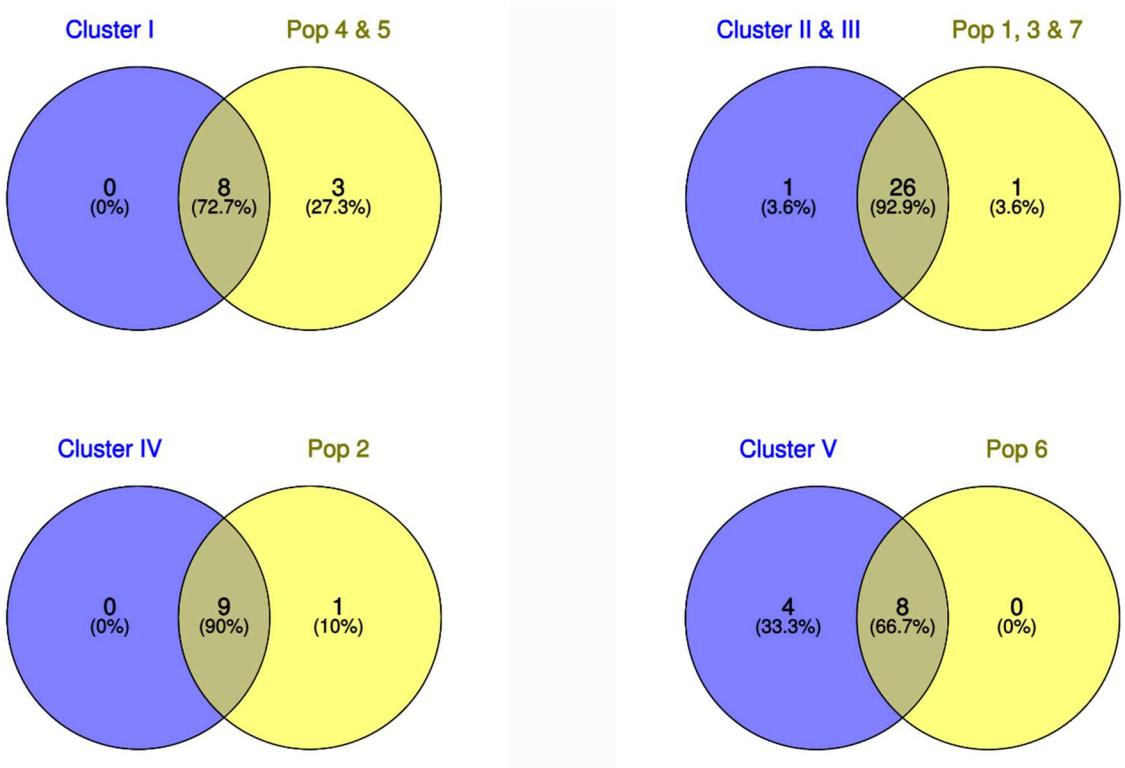

Figure S6. Venn diagram showing co-linearity between SSR-based NJ clusters and model-based populations. Overall, 80.6% co-linearity exists between NJ clusters and extracted model-based populations when $\Delta K = 7$.
