SDG IMPACT ASSESSMENT TOOL

Food Security

Description

During the future decades, food consumption will undoubtedly increase dramatically, necessitating increased production as a response to ensure food security. Future human health depends on reducing the impact of food production on the environment. wellness and prosperity, as additional land being used for agriculture would have a negative impact on the environment. As the need for food grows, economic demands to produce more of it will result in methods of land conversion and intensification that are detrimental to the environment and other goals of the food system. The negative effects of unsustainable intensification will hurt the environment and lessen its capacity to support future food production.
