

# Supplementary Materials: Macro Micro Studio: A Prototype Energy Autonomous Laboratory

Neil Burford, Rod Jones, Stephen Reynolds and David Rodley

## 1. Project Background, Facilitation, Funding and Limitations of the Research

### 1.1. Facilitation of the Research

The research was conducted as an interdisciplinary student project lead by the Macro Micro studio, a Masters Unit in Architecture and Planning [1]. The design was delivered by two cohorts of architecture students between September 2011 and June 2013. Following this, a number of students continued beyond their academic studies to assist in completing the construction of the building shell and internal fit-out. The majority of the construction was undertaken by students, with the exception of a number of specialist trades. Parallel quantitative research projects were conducted by MSc students in the departments of Physics and Engineering over the course of three years to support the design studies, including the sizing of the renewable energy system, FEA analysis of the structure, predicted environmental performance of the building using PHPP and a Whole Life Cost and Embodied Carbon analysis. Further input to the research and provision of the Structural Engineering Report (SER) was obtained from a major international engineering consultancy, a major international contractor advised and assisted in some aspects of the construction and Construction Design and Management (CDM) certification was obtained. Site overview was provided from the Universities Estates and Buildings Department. Edinburgh Napier University, Sustainable Construction Institute (SCI) advised and helped facilitate the acquisition of materials and systems for the building frame.

### 1.2. Project Phasing

In the first year between September 2011 and June 2012, the design was developed from concept to building warrant submission [2]. This initial stage was based on a design brief for a working studio environment for an Architectural Masters unit of 12 students occupying the space. The initial construction was based on a new Scottish manufactured Cross Laminated Timber (CLT) panel that was being prototyped by NorBuild in Forres in conjunction with SCI, using small element low-grade Scottish timber. The CLT was later substituted for a light weight frame due to the CLT being at too early a stage in development. The initial energy strategies and quantification of energy generation defined the PV area, roof angle, battery store and wind turbine size based on predicted data. An important aspect of this work was an economic feasibility study which considered revenue generated from government Feed-In-Tariff's that influenced the development of a business plan to underpin the future funding of the construction.

In the second year between September 2012 and June 2013, the brief was adapted to include wet services, a toilet and kitchen making the building suitable for letting commercially. The toilet was subsequently removed due to space constraints as a relaxation was obtained from Building Standards to use existing toilets on site. The occupant capacity was reduced to four people—considered a more realistic occupancy for the size of the space and in recognition that PH compliance could not be attained with the original occupancy target. A new Building Warrant application was submitted in early January 2013. The move to a lightweight frame facilitated the construction to be prototyped in the Fulton Structures Laboratory in Engineering, before being disassembled and moved to the site. Construction on site commenced in January 2013, with the timber frame being erected by the end of June 2013. Over a further nine months the remainder of the construction was completed, but with a delay in the electrical installation, meant that the final commissioning of the building at its current stage of development wasn't completed until August 2015. At present, research funding is being pursued for the next stages of the research.

### 1.3. Project Funding

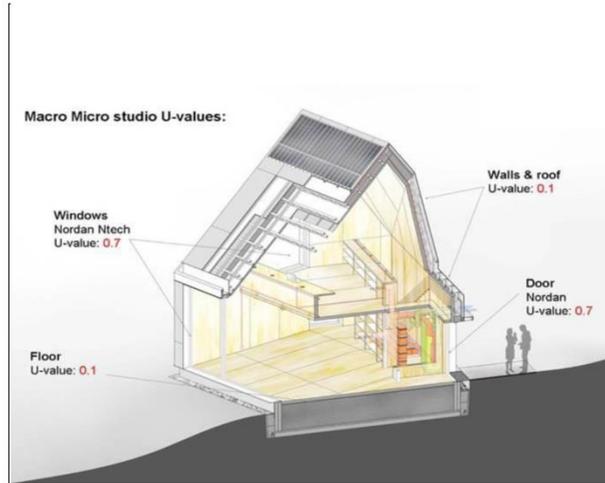

The project was funded primarily through industry in-kind donations of expertise and material of approximately £100,000. A number of main contributors were identified at the start of the project with the remainder being brought on board during the course of the project's development. A business plan was developed, after a failed Kickstarter bid, around revenue generation from rental of the space post-completion and Feed-In Tarrif (FIT's) income from energy generated from the renewable system. The University allocated £30,000 with a return on investment at the end of a three year period following completion. Additional funding was secured from the Scottish Forestry Commission, Creative Scotland, Scottish Funding Council Innovation Awards and a number of charitable trusts of approximately £50,000. This grant funding was developed around discrete elements of research e.g. the visualisation of data and the integration of renewable technologies. Charitable grants were used to pay for consumables and student labour beyond the end of the academic year.

#### *1.4. Challenges and Limitations to the Research*

The challenges to the project were exacerbated due to the fluid open-ended nature of the design as a result of having to train new student cohorts, lack of capital funding, uncertainty of industry contributions and the complex interdisciplinary, professional and industry interactions and timescales. The highly experimental nature of the design and technologies meant that many aspects of the project were unknown and with little previous precedent to refer to, increased the risk of failure. Some of these aspects such as the battery and energy management remain unresolved and require further major research investment. Managing the design and construction of a high performance prototype, the health and safety issues associated with unskilled labour coupled to existing demanding academic workloads has resulted in compromises and delayed the completion of the project. Limitations in the value engineering of the system has resulted in performance compromises. The ambition of the project to find solutions to new and non-traditional problems in creative ways captured the interest of industry due to the potential for product development and the considerable exposure brought by the innovative design. Some impact has already resulted from the work; being nominated and winning several design awards; being used as exemplar best practice by numerous suppliers; popular press, professional and web based dissemination has raised public, professional and political awareness of building energy efficiency and renewable energy requirements locally and nationally.

 Ground thermal conductance, H<sub>T,g</sub>  W/K

Heat recovery efficiency  $\eta_{HR}$   Effective air volume V<sub>V</sub>  m<sup>2</sup> \* Clear room height  m =  m<sup>3</sup>

SHX efficiency  $\eta_{SHX}$

### Summer ventilation continuous ventilation to provide sufficient indoor air quality

Air change rate by natural (windows & leakages) or exhaust-only mechanical ventilation, summer:  1/h

Mechanical ventilation summer:  1/h  with HR (check if applicable)

Energetically effective air change rate n<sub>V</sub>  +  \* (1 - ) +  =  1/h

Ventilation conduct. ambient H<sub>V,e</sub>  m<sup>3</sup> \*  1/h \*  W/(m<sup>2</sup>K) =  W/K

Ventilation conduct. ground H<sub>V,g</sub>  m<sup>3</sup> \*  1/h \*  W/(m<sup>2</sup>K) =  W/K

Additional summer ventilation for cooling Temperature amplitude summer  K

Select:  Window night ventilation, manual Corresponding air change rate  1/h  
 Mechanical, automatically controlled ventilation (for window ventilation: at 1 K temperature difference indoor - outdoor)

Minimum acceptable indoor temperature  °C

Orientation of the area	Angle Summer	Shading factor Summer	Dirt	g-value (perp. radiation)	Area m <sup>2</sup>	Portion of glazing	Aperture m <sup>2</sup>
1. North	0.9	0.98	0.95	0.50	3.1	68%	0.9

## Passive House Planning CLIMATE DATA

Standard regional climate: Select here

Regional climate data: ▼

Select region here

User data: ▼

Select regional climate here

East of Scotland: ▼

Building: HM Studio

Use regional data?  Yes

Climate building: East of Scotland

Chosen method for annual heating demand: Annual method

Monthly data: East of Scotland

Annual data: No

Use annual climate data set: No

Results: Annual heating demand: 18.4 kWh/m<sup>2</sup>a

Heating load: 11.6 W/m<sup>2</sup>

Transfer to annual method

Hr	205	3a
G <sub>g</sub>	69	WWh/m <sup>2</sup> a

## Passive House Planning INTERNAL HEAT GAINS

Building:

Utilisation Pattern: Residential building  W/m<sup>2</sup>

Type of Values Used: Standard  W/m<sup>2</sup>

Calculation	Persons	P	Annual Heating Demand	Heating Period	Useful Energy (kWh/a)	Included in Electricity Balance?	Availability	Used During Time Period (kWh/a)	Internal Heat Source (W)
Internal Heat Household	1.4	m <sup>2</sup>	10	205 d/a					
Column No.	1	2	3	4	5	6	7	8	9
Application	Existing (1/0), or number of people	In the Thermal Envelope (1/0)	Norm Consumption	Utilization Factor	Frequency				
Dishwashing	0	1	1.1 kWh/Use	1.00	65 / (P <sup>a</sup> )	0	0.30	8.76	0
Clothes Washing	0	1	1.1 kWh/Use	1.00	57 / (P <sup>a</sup> )	0	0.30	8.76	0
Clothes Drying with: Clothesline	1	0	3.5 kWh/Use	0.88	57 / (P <sup>a</sup> )	0	1.00	8.76	0
Energy Consumed by Evaporation	1	0	0.0 kWh/Use	0.60	57 / (P <sup>a</sup> )	0	0.80	8.76	0
Refrigerating	0	1	0.8 kWh/d	1.00	365 d/a	0	1.00	8.76	0
Freezing	0	1	0.9 kWh/d	1.00	365 d/a	0	1.00	8.76	0
or Combination	0	1	1.0 kWh/d	1.00	365 d/a	0	1.00	8.76	0
Cooking	1	1	0.3 kWh/Use	1.00	500 / (P <sup>a</sup> )	1.70	0.50	8.76	10
Lighting	1	1	11.0 W	1.00	2.9 kh/(P <sup>a</sup> )	43	1.00	8.76	5
Consumer Electronics	1	1	150.0 W	1.00	0.55 kh/(P <sup>a</sup> )	112	1.00	8.76	13
Household Appliances/Other	1	1	50.0 kWh	1.00	1.0 / (P <sup>a</sup> )	68	1.00	8.76	8
Auxiliary Appliances (cf. Aux Electricity Sheet)									0
Other Applications (cf. Electricity Sheet)	0	0.0				0	0	8.76	0
Persons	1	1	80.0 W/P	1.00	8.76 kh/a	951	0.55	8.76	60
Cold Water	1	1	-5.0 W/P	1.00	8.76 kh/a			8.76	-7
Evaporation	1	1	-25.0 W/P	1.00	8.76 kh/a	-297	1.00	8.76	-34
<b>Total</b>								W	<b>54</b>
<b>Specific Demand</b>								W/m <sup>2</sup>	<b>1.14</b>
<b>Heat Available From Internal Sources</b>						204.5 d/a		kWh/(m <sup>2</sup> a)	<b>5.6</b>
