

## Supplementary Material

### List of Appendix A

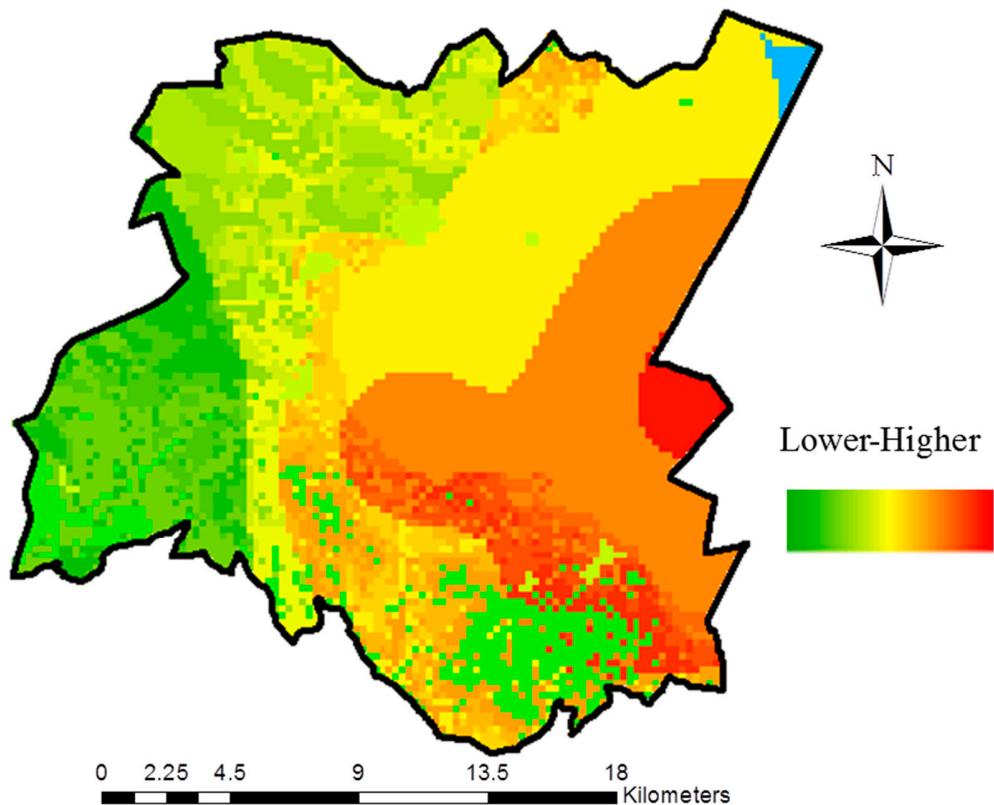

**Fig. A1** .Map of Ground water vulnerability (V), according to DRASTIC

**Fig. A2.** a) Map of distances to closest communication link. b) Map of accessibility index

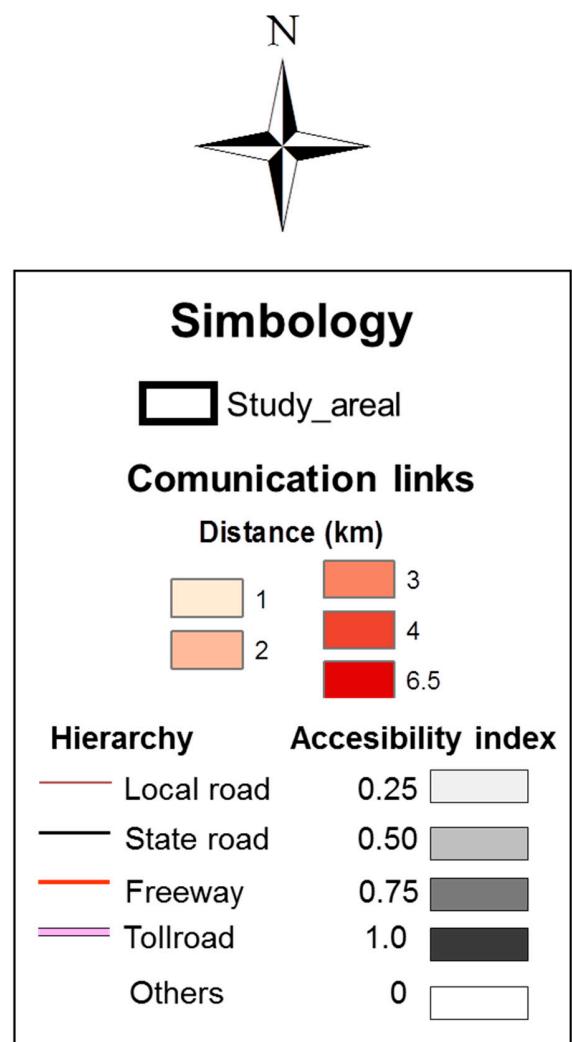

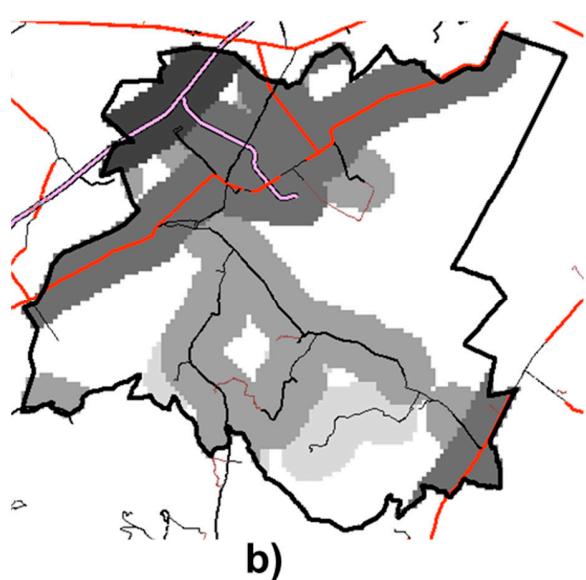

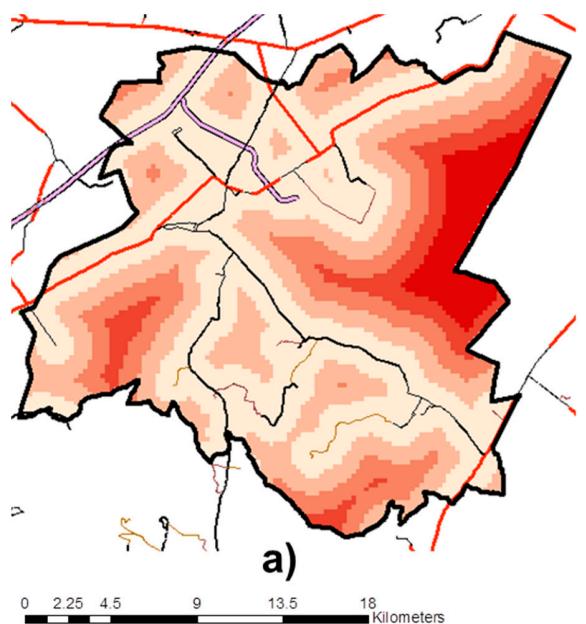

**Table A1.** Input data for F O3

**Table A2.** Aptitude factors per land-use type

**Table A3.** Input data per surface units (Ha) for F O2

**Fig. A1** .Map of Ground water vulnerability (V), according to DRASTIC

**Fig. A2.** a) Map of distances to closest communication link. b) Map of accessibility index

Table A1.  
Input data for F O3

|    | crop                   | harvested<br>land<br>rainfed<br>(%) | harvested<br>land<br>irrigated<br>(%) | kilocalories<br>per 100gr |
|----|------------------------|-------------------------------------|---------------------------------------|---------------------------|
| 1  | amaranth               | 97.3                                | -                                     | 371                       |

| 17 | meat from corn crop /b | 99                                  | 98.5                                  | 203                       |
| 18 | zucchini               | -                                   | 100                                   | 17                        |
| 19 | cabbage                | -                                   | 100                                   | 24                        |
| 20 | tomato                 | -                                   | 100                                   | 18                        |
| 21 | green tomato           | -                                   | 100                                   | 23                        |
| 22 | carrot                 | -                                   | 100                                   | 41                        |
| 23 | meat from grass /b     | 99                                  | -                                     | 203                       |

/b crop yield previously transformed into dry matter yield and then divided by  
the necessary tons for producing 1 ton of meat (local average)

**Table A1.** Input data for F O3

Table A2. Aptitude factors per land use type

|           | grassland | rainfed/irrigated land |
|-----------|-----------|------------------------|
| very high | 1.00      | 1.00                   |
| high      | 0.87      | 0.88                   |
| media     | 0.70      | 0.76                   |
| low       | 0.50      | 0.55                   |

according to yieldings recorded for the period 2004-2014

**Table A2.** Aptitude factors per land-use type

Table A3.  
Input data per surface unit (Ha) for F O2

| land use                | WF<br>(m <sup>3</sup> /Ha) | Polluting<br>potential<br>(P) | ton CO <sub>2</sub><br>eq /Ha |
|-------------------------|----------------------------|-------------------------------|-------------------------------|
| forest                  | 3424.80                    | 10                            | 0.00                          |
| grassland               | 5756.77                    | 15                            | 8.72                          |
| rain fed                | 3424.76                    | 50                            | 2.99                          |
| irrigated               | 6423.35                    | 50                            | 2.99                          |
| industrial (automotive) | 258.00                     | 50                            | 42.81                         |
| urban                   | 4392.67                    | 50                            | 197.08                        |
