

Supplementary Materials

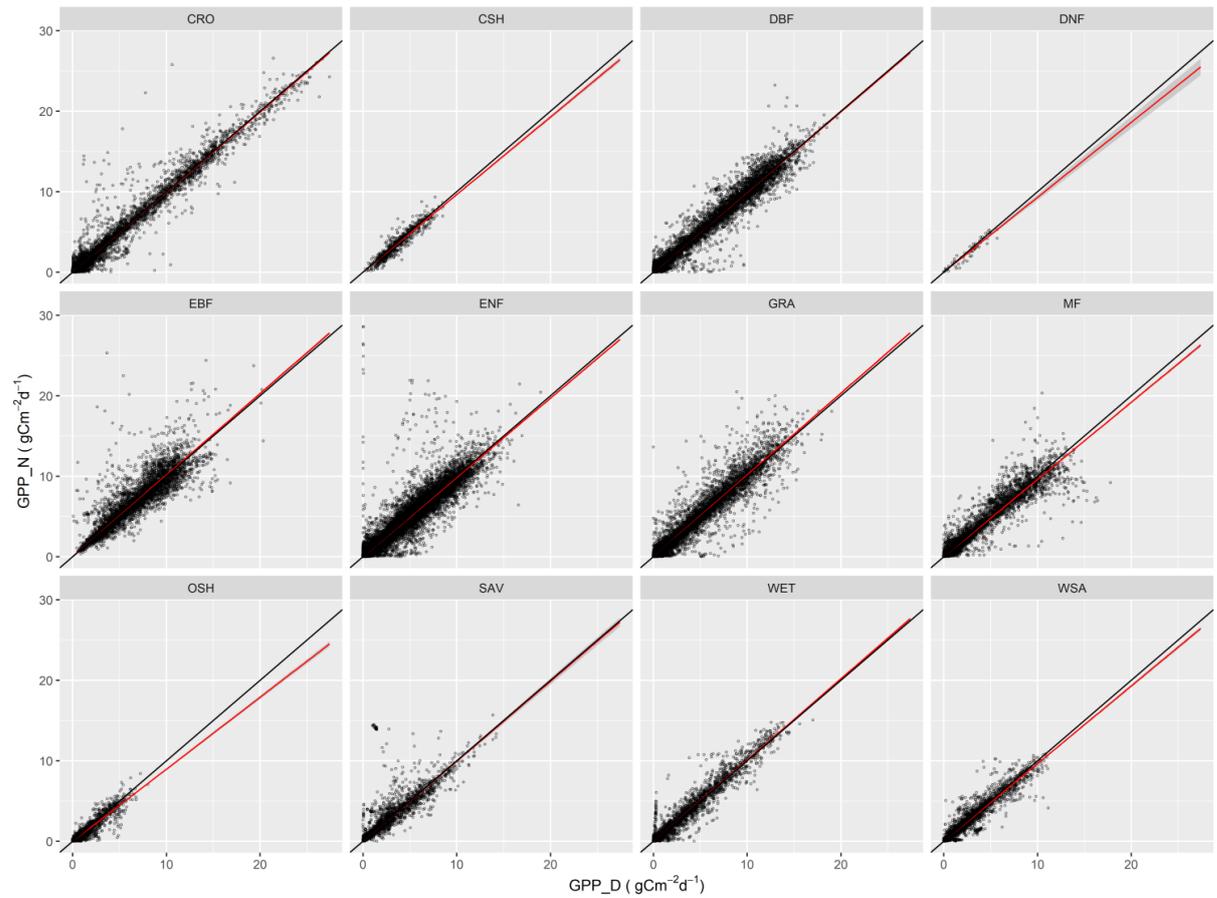

Figure S1 There are significant difference between GPP_N and GPP_D across all 12 biomes except EBF and WET.

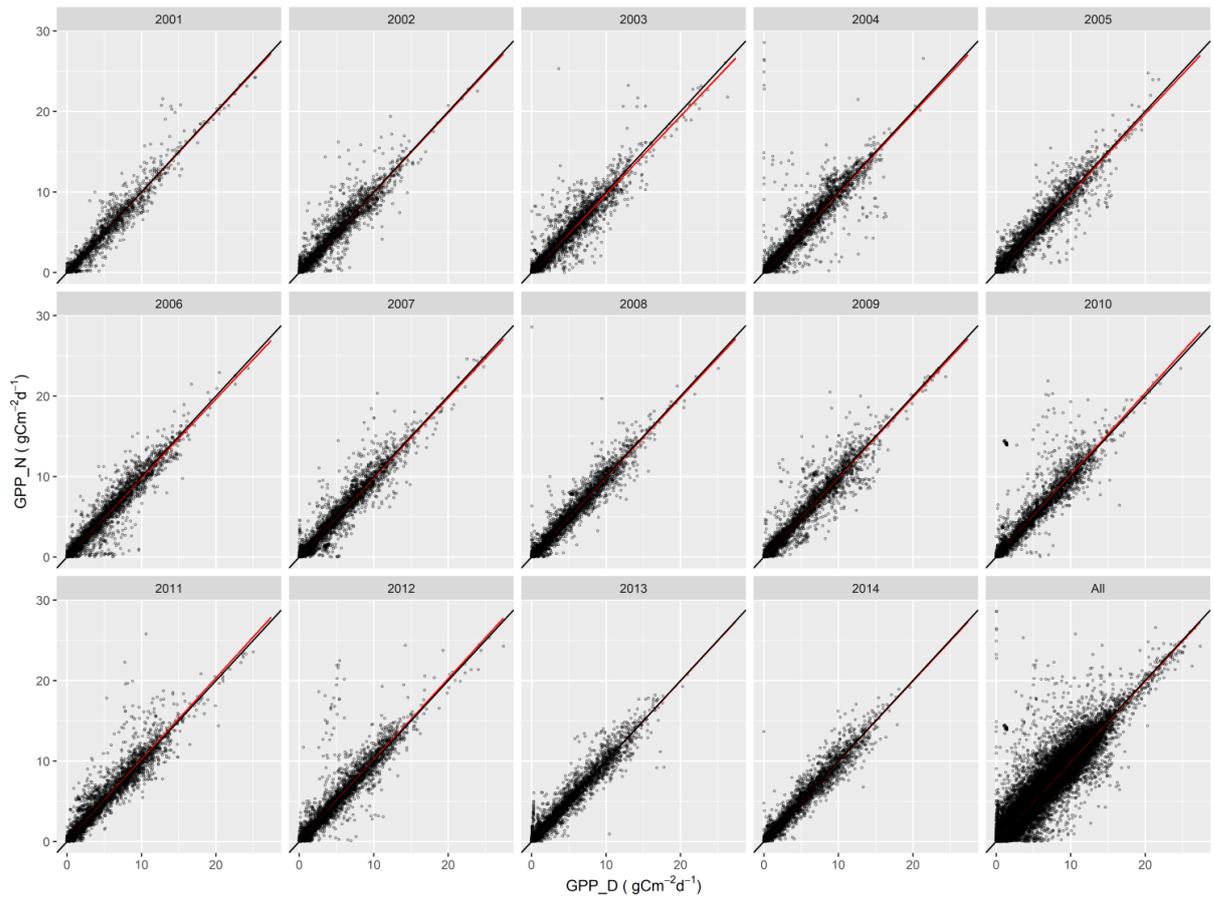

Figure S2. There are significant difference between GPP_N and GPP_D across all 14 years except 2011, 2012 and 2014.

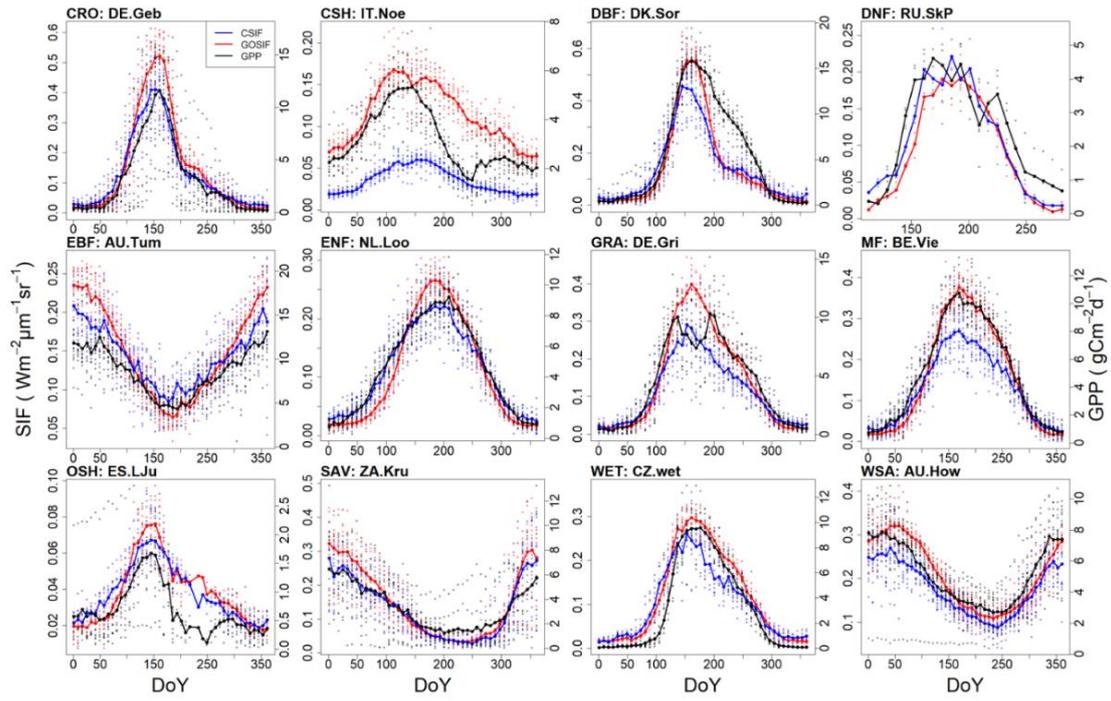

Figure S3. Annual change of SIFc (GOSIF (red) and CSIF (blue)) and GPP (black) for 12 biomes at site level.

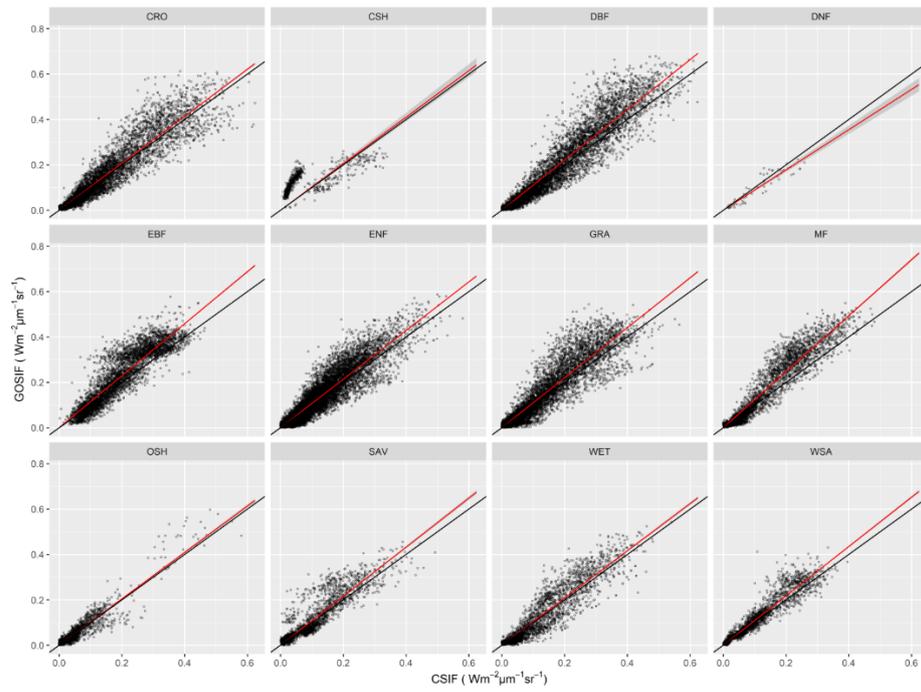

Figure S4. There are significant differences between GOSIF and CSIF across all 12 biomes except CSH.

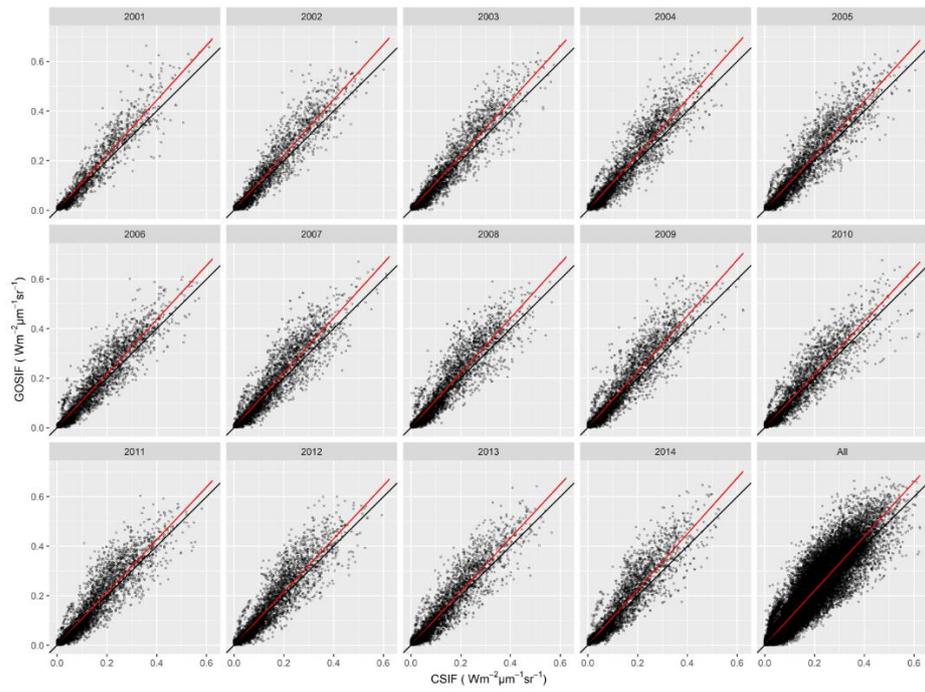

Figure S5. There are significant differences between GOSIF and CSIF across all 14 years.

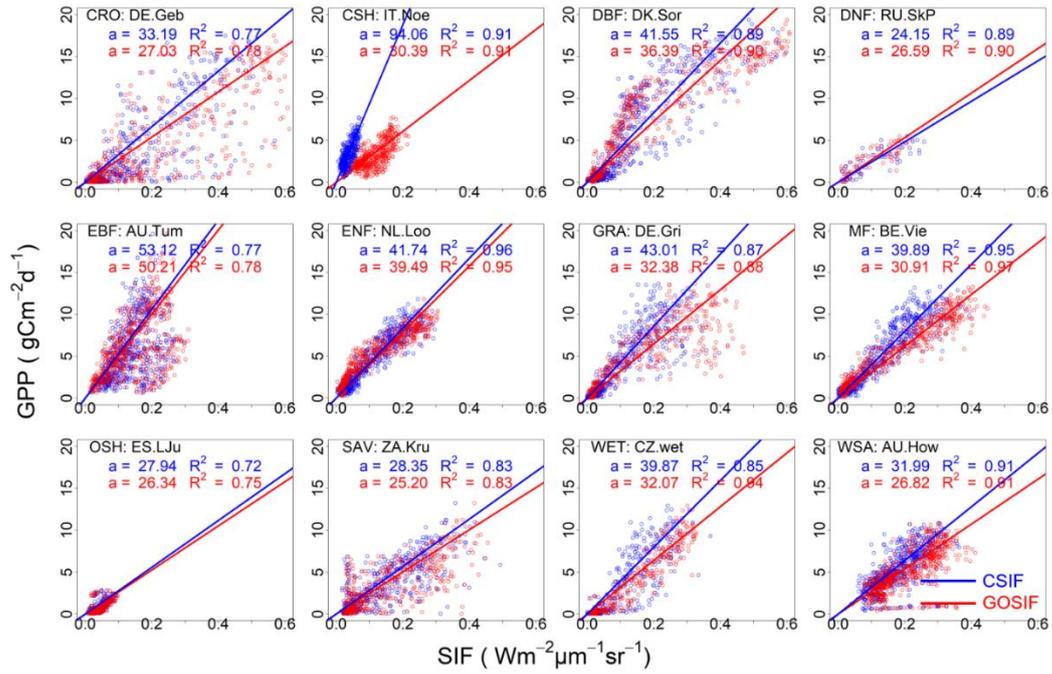

Figure S6. Scatter plots and linear regression of GPP_M and SIFc (CSIF and GOSIF) for 12 individual biomes at site level ($p < 0.001$).

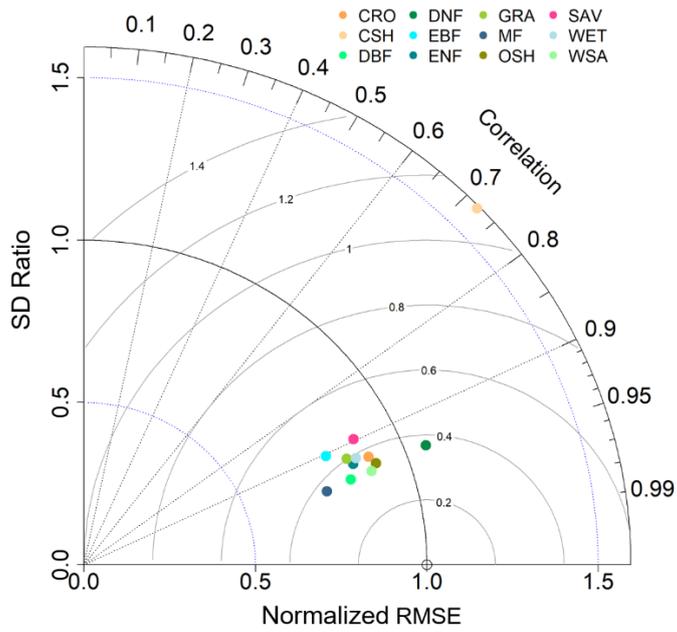

Figure S7. The Taylor diagram showing the difference between CSIF and GOSIF across 12 biomes. Color dots represent GPP in the corresponding legend pie. Taylor diagram is a polar graph in which the cosine of the angle between the X-axis is the correlation coefficient between Flux-GPP and modeled GPP (from CSIF and GOSIF). The radial direction is standard deviation (SD). The grey arcs represent RMSE.

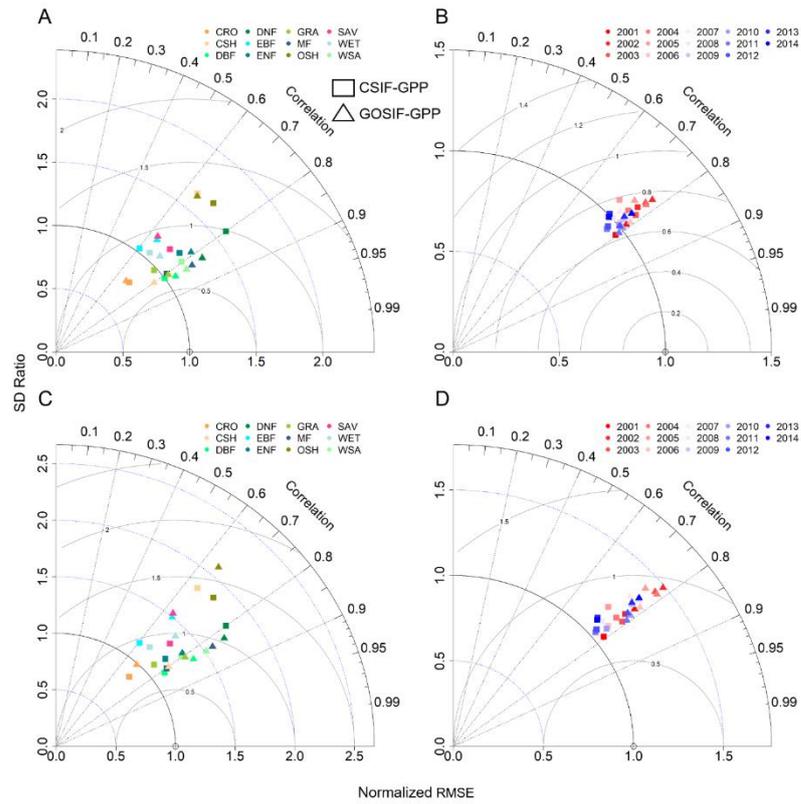

Figure S8. The Taylor diagram showing the performance of CSIF_GPP and GOSIF_GPP with Flux_GPP across 12 biomes (A, C) and 14 years (B, D). A and B for median value based two-slope scheme, C and D for mean value based two-slope scheme. Taylor diagram is a polar graph in which the cosine of the angle between the X-axis is the correlation coefficient between Flux-GPP and modeled GPP (from CSIF and GOSIF). The radial direction is the ratio of standard deviation. The grey arcs represent normalized RMSE for each model.

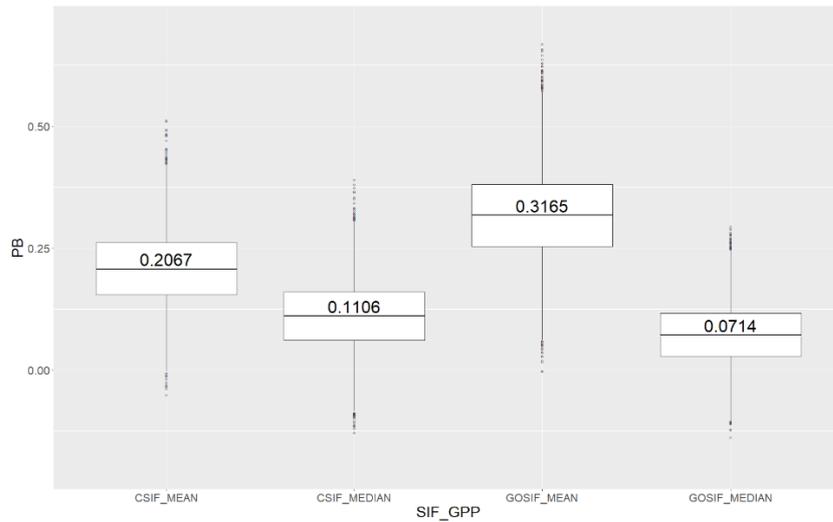

Figure S9. PB distribution of SIF_GPP with EC_GPP among different SIF_GPP derived two-slope schemes. PB represents Percentage Bias ($[\text{sum}(\text{SIF_GPP}) - \text{sum}(\text{EC_GPP})] / \text{sum}(\text{EC_GPP})$) for each SIF_GPP and EC_GPP combination. CSIF_MEAN and CSIF_MEDIAN mean SIF_GPP derived from CSIF with two-slope scheme based on mean values and median values, respectively. GOSIF_MEAN and GOSIF_MEDIAN mean SIF_GPP derived from GOSIF with two-slope scheme based on mean values and median values, respectively. Each box represents a 10 thousand times random sampling, and each sampling used 80% of the total sites (165) for calibration and 20% (43) sites for validation. And the solid line with corresponding value above represents the median value of each box. There were significant differences among all the groups ($p < 0.001$).

Table S1. Introduction of three ecosystem carbon cycle indicators that used in this study. They are GPP_N, GPP_D and GPP_M.

Abbreviation	Indicator name	Description
GPP_N	GPP_NT_VUT_MEAN	From Nighttime partitioning method, average from GPP versions, each from corresponding NEE_VUT_XX version
GPP_D	GPP_DT_VUT_MEAN	From Daytime partitioning method, average from GPP versions, each from corresponding NEE_VUT_XX version
GPP_M	GPP_MEAN	The averaged value from both GPPd and GPPn.

Table S2 208 of 212 FLUXNET2015 Tier-1 sites used in this study. Site descriptions includes site ID, site name, years of data available, latitude, longitude, biome type and correlation coefficient between EC_GPP with CSIF and GOSIF.

Table S3. The definition of 12 IGBP land cover types (biomes) used in this study referred to Belward [1] and Loveland, Reed [2]

IGBP	Code	Class name	Number of site	Definition
CRO	12	Croplands	20	Lands covered with temporary crops followed by harvest and a bare soil period (e.g., single and multiple cropping systems). Note that perennial woody crops will be classified as the appropriate forest or shrub land cover type.
CSH	6	Closed Shrublands	3	Lands with woody vegetation less than 2 m tall and with shrub canopy cover >60%. The shrub foliage can be either evergreen or deciduous.
DBF	4	Deciduous Broadleaf Forest	26	Lands dominated by woody vegetation with a percent cover >60% and height exceeding 2 m. Consists of broadleaf tree communities with an annual cycle of leaf-on and leaf-off periods.
DNF	3	Deciduous Needleleaf Forest	1	Lands dominated by woody vegetation with a percent cover >60% and height exceeding 2 m. Consists of seasonal needleleaf tree communities with an annual cycle of leaf-on and leaf-off periods
EBF	2	Evergreen Broadleaf Forest	15	Lands dominated by broadleaf woody vegetation with a percent cover >60% and height exceeding 2 m. Almost all trees and shrubs remain green year round. Canopy is never without green foliage.
ENF	1	Evergreen Needleleaf Forest	48	Lands dominated by needleleaf woody vegetation with a percent cover >60% and height exceeding 2 m. Almost all trees remain green all year. Canopy is never without green foliage.
GRA	10	Grasslands	37	Lands with herbaceous types of cover. Tree and shrub cover is less than 10%.
MF	5	Mixed Forests	9	Lands dominated by trees with a percent cover >60% and height exceeding 2 m. Consists of tree communities with interspersed mixtures or mosaics of the other four forest types. None of the forest types exceeds 60% of landscape
OSH	7	Open Shrublands	14	Lands with woody vegetation less than 2 m tall and with shrub canopy cover between 10% and 60%. The shrub foliage can be either evergreen or deciduous
SAV	9	Savannas	8	Lands with herbaceous and other understory systems, and with forest canopy cover between 10% and 30%. The forest cover height exceeds 2 m
WET	11	Persistent Wetlands	21	Lands with a permanent mixture of water and herbaceous or woody vegetation. The vegetation can be present either in salt, brackish, or fresh water.
WSA	8	Woody Savannas	6	Lands with herbaceous and other understory systems, and with forest canopy cover between 30% and 60%. The forest cover height exceeds 2 m.
