| Total | 880 | 712 | 188 | 166 | 133 | 73 | 70 | 2222 |

${ }^{\text {a }}$ Food groups were defined based on the culinary usage and the similarity of nutrient profiles of the foods, mainly according to the Standard Tables of Food composition in Japan 2015 (STFCJ) [40,41]. ${ }^{\mathrm{b}}$ Step 1: assign values available in STFCJ [40,41]; step 2: assign 0 g per 100 g of food to foods with $<1 \mathrm{~g}$ available carbohydrates (calculated as subtracting dietary fiber content (g per 100 g of food) from carbohydrate) per 100 g ; step 3: assign analytical values reported in the literature; step 4: use values of similar foods available in STFCJ [40,41]; step 5: estimated based on recipes or ingredients; step 6: use values from food composition databases in other countries (the US [43], the UK [44], and Australia [45]); step 7: assign 0 g per 100 g of food.
${ }^{\text {c }}$ A literature search was conducted based on the PubMed, Ovid Medline, CiNii, and Ichushi-Web (a database for Japanese papers) databases, to identify studies that reported sugar content in Japanese foods. The search terms that were used included "(sugar OR sugars OR saccharide OR saccharides OR monosaccharide OR monosaccharides OR disaccharide OR disaccharides OR glucose OR fructose OR galactose OR sucrose OR maltose OR lactose OR trehalose) AND food AND (Japan OR Japanese)." Only papers that were written in English or Japanese were considered. References from relevant papers were also manually searched. Of 15 papers identified (seven based on high-performance liquid chromatography (HPLC) [48,49,52-54,89,90], one based on both HPLC and gas chromatography (GC) [55], four based on GC [56-58,91], and three based on enzymatic methods [50,51,59]), the papers in which data were obtained using HPLC were primarily considered; then, the papers in which data were obtained using GC or enzymatic methods were considered [92]. When multiple papers reported saccharide contents of the same food items using the same analytical methods, the value from the
newest paper was used, since the sugar contents in food items might change over time due to selective breeding, progress in cultivating techniques, and reformulation of commercial products [93,94]. Consequently, values reported in three [89,90,91] of the 15 candidate papers were not used. For each food item, the mean or median value was used as a representative value.
${ }^{\mathrm{d}}$ Consisting of soda, sports drinks, fruit drinks, milk beverages, and pre-sweetened tea and coffee.

| Total | 880 | 712 | 19 | 232 | 161 | 50 | 100 | 68 | 2222 |

${ }^{\text {a }}$ Food groups were defined based on the culinary usage and the similarity of nutrient profiles of the foods, mainly according to the Standard Tables of Food composition in Japan 2015 (STFCJ) [40,41]. ${ }^{\mathrm{b}}$ Step 1: assign values available in STFCJ [40,41]; step 2: assign 0 g per 100 g of food to foods with $<1 \mathrm{~g}$ available carbohydrates (calculated as subtracting dietary fiber content ( g per 100 g of food) from carbohydrate) per 100 g ; step 3: assign analytical values reported in the literature; step 4: use values of similar foods available in STFCJ [40,41]; step 5: estimated based on recipes or ingredients; step 6: use values from food composition databases in other countries (the US [43], the UK [44], and Australia [45]) ; step 7: assign values calculated as subtracting total sugar contents from available carbohydrate contents (calculated as subtracting dietary fiber contents from carbohydrate contents); step 8: assign 0 g per 100 g of food.
${ }^{\text {c }}$ A literature search was conducted based on the PubMed, Ovid Medline, CiNii, and Ichushi-Web (a database for Japanese papers) databases, to identify studies that reported starch contents in Japanese foods using the search terms "(starch OR starches) AND food AND (Japan OR Japanese)." In total, three papers were identified: two based on enzymatic methods [60,95] and one based on Somogyi methods [61]. Since a part of the samples that were analysed in one paper [58] based on enzymatic methods were assumed to be analysed in another paper [95], values that were reported in two specific papers $[60,61]$ were used. For each food item, the median value was used as a representative value. ${ }^{d}$ Consisting of soda, sports drinks, fruit drinks, milk beverages, and pre-sweetened tea and coffee.

SD, standard deviation; BMI, body mass index; EI, energy intake; and EER, estimated energy requirement.
a 91-93 boys or girls for the each of the 18-23 months and 24-35 months.
${ }^{\mathrm{b}} 44-48$ boys or girls for the each of the $3,4,5$, and 6 years.
c 135-176 boys or girls for each of the 2-year age groups ( $8-9,10-11$, and $13-14$ years).
d 37-42 men or women for each of the 10-year age groups ( $20-29,30-39,40-49,50-59$, and $60-69$ years).
${ }^{e}$ Months for toddlers and years for other participants.
${ }^{f}$ Measured to the nearest 0.1 cm (height) and 0.1 kg (weight) while the participants wearing light clothing and no shoes.
g Calculated by dividing body weight in kilograms by the squared body height in meters.
${ }^{\text {h }}$ For toddlers, EI was estimated using 1-day dietary data. For other participants, habitual EI was calculated based on the best-power method (performed with HabitDist [70]) by using 3-day dietary data for preschool children and schoolchildren or 4-day dietary data for adults [71, 72].
${ }^{i}$ Calculated as the ratio of reported EI to EER for each participant using the sex-and age-specific EER for medium level of physical activity in Dietary
Reference Intakes for Japanese, 2015 [73]. EER (kcal/day) used was: 950 (for boys aged 18-35 months), 900 (for girls aged 18-35 months); 1300 (for boys aged 3-5 years), 1250 (for girls aged 3-5 years), 1550 (for boys aged 6 years), 1450 (for girls aged 6 years), 1850 (for boys aged 8-9 years), 1700 (for girls aged 8-9 years), 2250 (for boys aged 10-11 years), 2100 (for girls aged 10-11 years), 2600 (for boys aged 13-14 years), 2400 (for girls aged 13-14 years), 2650 (for men aged 20-49 years), 1950 (for women aged 20-29 years), 2000 (for women aged 30-49 years), 2450 (for men aged 50-69 years), and 1900 (for women aged 50-69 years) [73].

${ }^{\text {a }}$ Estimated using 1-day dietary data.
${ }^{\mathrm{b}}$ Habitual intake was calculated based on the best-power method (performed with HabitDist [70]) by using 3-day dietary data for preschool children and schoolchildren or 4-day dietary data for adults [71, 72].
${ }^{\text {c }}$ Significantly different from the corresponding male group determined by independent $t$-test for continuous variables and chi-square test for categorical variables; * $\mathrm{P}<0.05,{ }^{* *} \mathrm{P}<0.01,{ }^{* * *} \mathrm{P}<0.001$.

Table S6 Contribution (\%) of each food group to intakes of maltose, lactose, trehalose, glucose, and galactose in Japanese children and adults ab

| Nutrients | Food groups ${ }^{\text {cd }}$ | Toddlers (Aged 18-35 months) $(n=368)$ | $\begin{gathered} \text { Preschool children } \\ \text { (Aged 3-6 years) } \\ (n=376) \end{gathered}$ | $\begin{gathered} \text { Schoolchildren } \\ \text { (Aged 8-14 years) } \\ (n=915) \end{gathered}$ | $\begin{gathered} \text { Adults } \\ \text { (Aged 20-69 years) } \\ (n=392) \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Maltose | Bread | 24.3 | 26.1 | 27.2 | 25.0 |
|  | Seasonings | 19.5 | 14.2 | 17.9 | 20.9 |
|  | Confectionaries | 18.0 | 23.3 | 17.7 | 12.2 |
|  | Potatoes | 10.2 | 6.2 | 3.1 | 4.3 |
|  | Noodle | 7.5 | 10.6 | 12.6 | 13.5 |
|  | Others | 20.5 | 19.6 | 21.4 | 24.2 |
| Lactose | Dairy products | 83.8 | 67.1 | 68.2 | 38.0 |
|  | Sugar-sweetened beverages ${ }^{\text {e }}$ | 7.6 | 10.2 | 5.7 | 13.9 |
|  | Confectionaries | 4.8 | 14.8 | 15.0 | 20.6 |
|  | Seasonings | 2.8 | 4.7 | 6.6 | 18.0 |
|  | Others | 1.1 | 3.2 | 4.5 | 9.5 |
| Trehalose ${ }^{\text {f }}$ | Mushrooms | 69.4 | 55.9 | 61.6 | 50.4 |
|  | Bread | 20.0 | 27.9 | 24.9 | 26.8 |
|  | Other grain products | 5.3 | 5.3 | 4.9 | 8.2 |
|  | Noodle | 3.5 | 10.0 | 6.4 | 12.4 |
|  | Others | 1.8 | 0.9 | 2.2 | 2.2 |
| Glucose | Fruits | 27.3 | 21.0 | 10.3 | 10.5 |
|  | Vegetables | 24.2 | 21.8 | 29.1 | 28.1 |
|  | Seasonings | 17.4 | 17.4 | 24.4 | 25.1 |
|  | Sugar-sweetened beverages ${ }^{\text {e }}$ | 9.6 | 12.7 | 10.4 | 9.1 |
|  | Others | 21.5 | 27.1 | 25.9 | 27.2 |
| Galactose | Seasonings | 49.5 | 53.7 | 71.0 | 67.3 |
|  | Dairy products | 29.7 | 25.4 | 21.4 | 19.0 |
|  | Sugar-sweetened beverages ${ }^{\text {e }}$ | 19.1 | 16.4 | 3.9 | 9.3 |
|  | Others | 1.7 | 4.5 | 3.7 | 4.4 |

a Values are means. The mean value of contribution was calculated by using 1-day dietary data (for toddlers) or the mean of 3- or 4-day dietary data (for other age groups).
${ }^{\mathrm{b}}$ Only food groups with $\geq 7 \%$ contribution in at least one population or at least top three contributors are listed. Food groups with $<7 \%$ contribution in all populations are not shown, and combined into others.
${ }^{\text {c }}$ Twenty-four food groups were defined based on the culinary usage and the similarity of nutrient profiles of the foods, mainly according to the Standard Tables of Food composition in Japan 2015 [40, 41]. They consisted of rice and grains, pulses and nuts, sugars and jams, seaweeds, fish and shellfish, meats, eggs, fat and oil, alcoholic beverages, vegetable juices, fruit juices, tea and coffee, and other foods in addition to the items listed in this table.
${ }^{\mathrm{d}}$ Food groups are listed in descending order of the contribution in toddlers.
${ }^{\mathrm{e}}$ Consisting of soda, sports drinks, fruit drinks, milk beverages, and pre-sweetened tea and coffee.
${ }^{\mathrm{f}} \mathrm{n} 320$ for toddlers, n 373 for preschool children, n 913 for schoolchildren, and n 386 for adults due to the presence of nonconsumers.
