Data (n = 2622) are means (\pm standard deviation) or n (%). $P < 0.05$ was considered statistically significant. Abbreviations; AgeCoDe, German Study on Aging, Cognition and Dementia in Primary Care Patients; *APOE ε4*, apolipoprotein E ε4 allele; MCI, mild cognitive impairment; CCI, Charlson comorbidity index; CERAD; Consortium to Establish a Registry for Alzheimer's Disease; AD, Alzheimer's dementia.

Table S2. Specification of the multiple imputation procedure.

Software	IBM SPSS Statistics for Windows (Release 21)
Imputation method	Fully conditional specification (Markov chain Monte Carlo method)
Key settings	Maximum iterations: 20
Imputed data sets	10
Variables included in the imputation procedure (imputed or used as predictors of missing data):	olive oil, fresh fish, red wine, white wine, green tea, coffee, meat and sausages, fruits and vegetables, memory score FU1-FU8, Visit FU1-FU8, incidence of dementia FU1-FU8, incidence of Alzheimer's dementia (AD) FU1-FU8, incidence of vascular dementia FU1-FU8, duration to develop (AD) dementia FU1-FU8, cognitive health status (cognitively normal, MCI, overall dementia), age, gender, <i>APOE ε4</i> , education (baseline), height (cm), weight (kg), physical activity score, smoking, hypercholesterolemia, depression, myocardial infarction, congestive heart failure, peripheral vascular diseases, cerebro vascular diseases, rheumatism (baseline), diabetes, chronic kidney diseases, liver diseases.
Additionally added predictive variables to increase plausibility of missing at random assumption:	medication FU1, housekeeping FU1, diabetes (baseline), cardiovascular diseases (baseline), renal insufficiency (baseline), hypercholesterolemia (baseline), liver diseases (baseline)
Not normally distributed variables were treated with:	Predictive mean matching
Binary/categorical variables were treated with:	Logistic regression models

Abbreviations: FU, follow up; MCI, mild cognitive impairment; *APOE ε4*, apolipoprotein E ε4 allele.

Based on imputed data ($n = 2622$).Model 1 is adjusted for age, gender, BMI, education and *APOE ε4* carrier status.

Model 2 is adjusted as for model 1, plus smoking status, physical activity score, depression, hypercholesterolemia, and a modified CCI score.

 $P < 0.05$ was considered statistically significant.Abbreviations: JM, joint modelling; HR, hazard ratio; AD, Alzheimer's dementia; BMI, body mass index; *APOE ε4*, apolipoprotein E ε4 allele.
