

Supplementary Figure 1: Supplementary Figure 1: Gut microbiome composition of pre- and post-HSCT samples of patients fed with enteral and parenteral nutrition. Bar plots indicating the relative abundance of the most represented phyla (A.) and families (B.) in both enteral (E) and parenteral (P) feeding patients pre (PRE), during the transplant (HSCT) and up to 120 days post HSCT (POST). Only taxa with relative abundance >0.1% in at least 2 samples were included.
