

A**B**

Supplemental Figure 2. Gene expression in MLN-DCs (**A**) and spleen-DCs (**B**) from naïve mice cultured for 24 h with different stimuli (OP, RA, OP+IL-4, or RA+IL-4), assayed by qPCR, normalized to the reference gene *Actb*, and expressed relative to DCs cultured in RPMI. Data are means \pm SEM (biological and technical triplicates). Different letters indicate statistically significant differences ($p < 0.05$) calculated using Mann-Whitney U test.
