Table S4. C2C12 myotubes were treated with TNF α (tumor necrosis factor α)/IFN γ (interferon γ), Dex (dexamethasone) or PBS (phosphate buffered saline) in the absence or presence of the selected plant extracts for 48h (TNF α /IFN γ and Dex) or 16h (PBS) and IF for myosin heavy chain (MyHC)-II was performed. Reported are the percentages of myotube diameter changes in comparison to untreated myotube.

Supplementary Figure 1. C2C12 myotubes were treated with one-hundred different plant extract (100 μ g/mL) for 48h. May-Grünwald/Giemsa staining was performed and total myotube area was measured by *Image J* software. The graph reports the percent changes in myotube area relative to untreated control.

Supplementary Figure 2. (A,B) C2C12 myotubes were treated with T (tumor necrosis factor α , 20 ng/mL)/I (interferon γ , 100 U/mL) (T/I) in the absence or presence of each selected 96 plant extracts (100 μ g/mL) for 48h. May-Grünwald/Giemsa staining was performed and total myotube areas were measured by *Image J* software (A). The graph reports the percent changes in myotube area with respect to untreated control. Dotted line indicates the arbitrary cut off to select the extracts

able to impair T/I-dependent myotube area reduction up to 10% (A). Reported are representative images of the 17 extracts selected for further investigation. Bars, 500 μ m (B).

Supplementary Figure 3. C2C12 myotubes were untreated or treated with dexamethasone (Dex, 1 μ M) for 48h (A) or starved with PBS (phosphate buffered saline) for 16h (B) in absence or presence of the selected 10 plant extracts. Immunofluorescence (IF) analysis for myosin heavy chain (MyHC)-II was performed and myotube diameters were measured by *Image J* software. Reported are representative images with average myotube diameters (μ m) \pm SD (standard deviation). Bars, 100 μ m.

Supplementary Figure 4. Full 1 H NMR (Nuclear Magnetic Resonance) spectra of the most active extracts, with highlighted extended regions on top of the figure; diagnosis signals of: 1=alanine, 2=quinic acid, 3=aspartate, 4=malic acid, 5=citric acid, 6=sucrose, 7= β -glucose, 8= α -glucose, 9=caffeic acid, 10=shikim acid, 11=trigonelline.

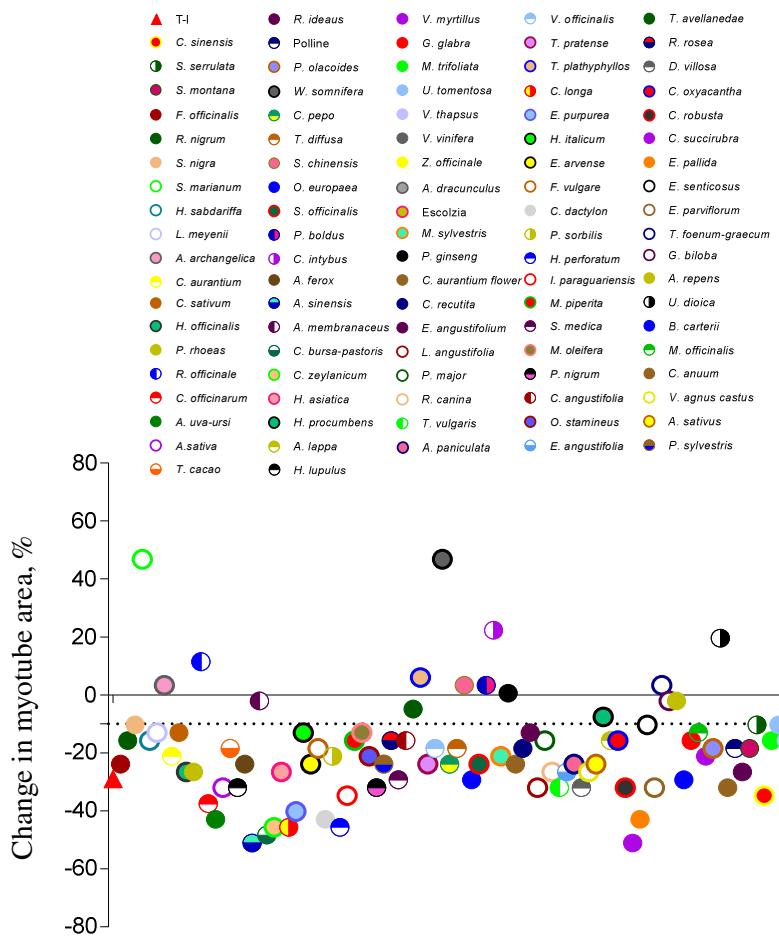

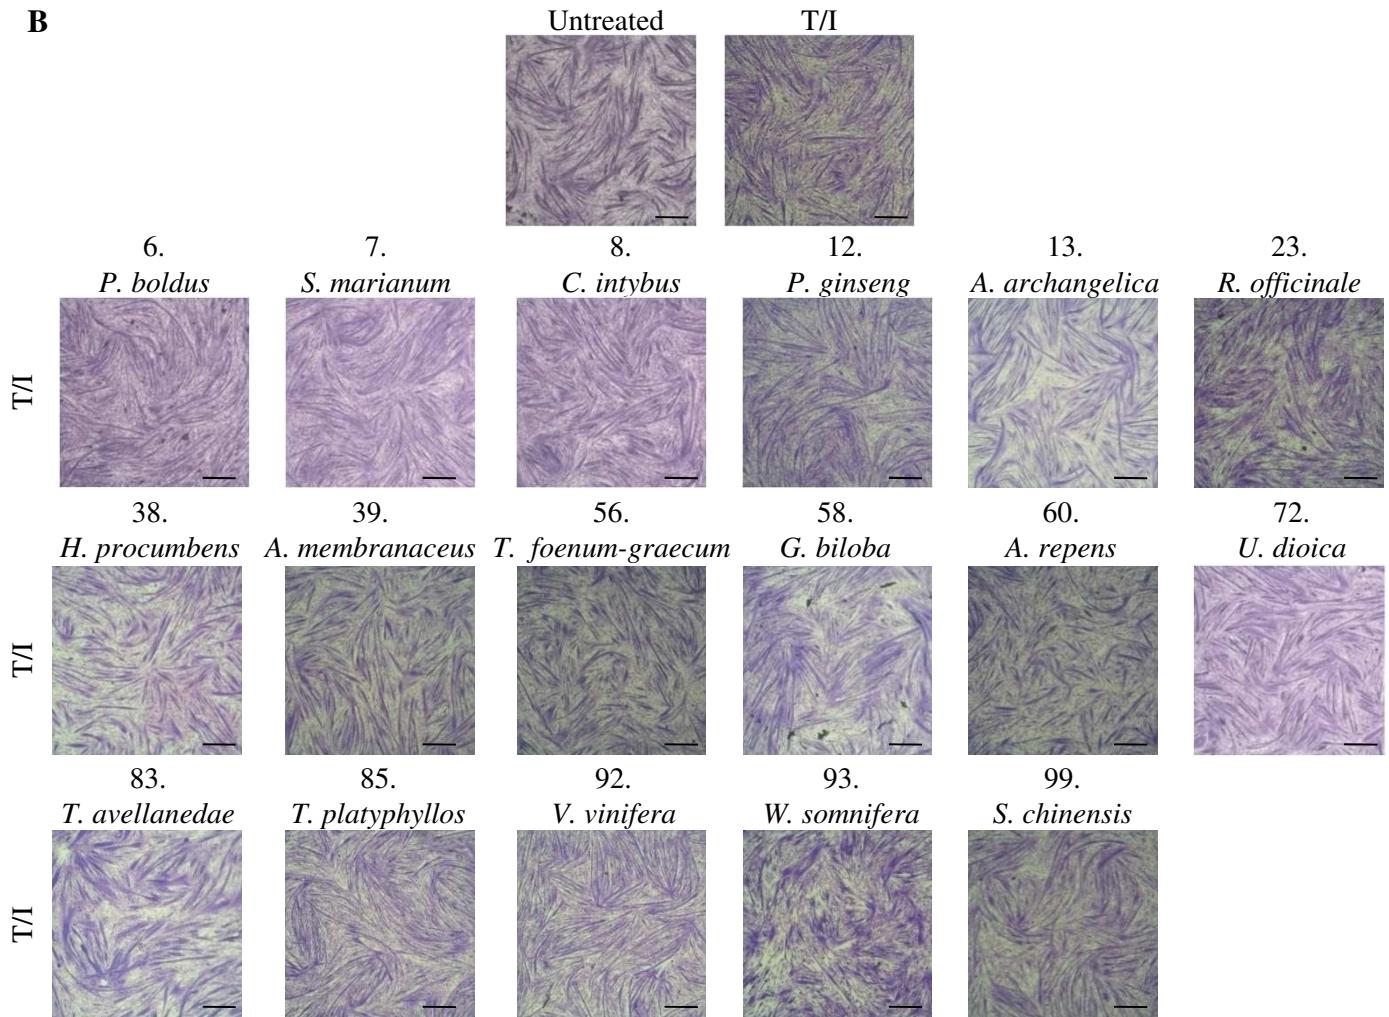

Supplementary Figure 5. (A) C2C12 myotubes were treated with TNF α (tumor necrosis factor α , 20 ng/mL)/IFN γ (interferon γ , 100 U/mL) (T/I) in the absence or presence of ten selected plant extracts (100 μ g/mL) for 48h and the expression of myosin heavy chain (MyHC)-II expression were analyzed by WB (western blotting). Reported are representative images. Reported are the relative densities with respect to tubulin. Statistical analysis was conducted using t-test * p <0.05, ** p <0.01 significantly different from untreated control. (B) C2C12 myotubes were treated with T/I in the absence or presence of the 20 different herbal formulations (100 μ g/mL) for 48h. May-Grünwald/Giemsa staining was performed and total myotube area was measured by *Image J* software. The graph reports the percent changes in myotube area relative to untreated control. Five formulations were able to counteract the reduction of the myotube area induced by T/I. Bars, 500 μ m.

Supplementary Figure 6. C2C12 myotubes were treated with TNF α (tumor necrosis factor α , 20 ng/mL)/IFN γ (interferon γ , 100 U/mL) (T/I) (A,B) or dexamethasone (Dex, 1 μ M) (C,D) in the absence or presence of WST (100 μ g/mL). WB (western blotting) analysis was performed to verify p-ERKs (phospho-extracellular signal-regulated kinases), ERKs, p-p65 (phospho-NF- κ B p65, nuclear factor kappa-light-chain-enhancer of activated B cells p65) and p65 levels after 6h, whereas p-mTOR (mammalian target of rapamycin), mTOR and MyoD (myoblast determination protein 1) expression were analyzed after 48h (A,C). Tubulin was used as protein loading control (A,C). Levels of *Myh2* (*Myosin heavy chain 2*) and *Fbxo32* (*muscle atrophy F-box protein*) were analyzed after 24h by real-time PCR. (E) Myotubes were treated with WST and analyzed after 48h by IF (immunofluorescence) for myosin heavy chain (MyHC)-II. Reported are representative images

(A,C,E). Reported are the relative densities with respect to tubulin or total form of phosphorylated protein (A,C). Results are means \pm SD (standard deviation) (A-E). Statistical analysis was conducted using t-test * $p<0.05$, ** $p<0.01$ significantly different from untreated control; # $p<0.05$ and ## $p<0.01$ significantly different from T/I (A,B,E) or Dex (C,D).
