

Supplementary Figure S1. Effects of time-restricted feeding (TRF) on infiltration of B cells and natural killer (NK) cells. Stromal vascular fraction of epididymal adipose tissue was analyzed by flow cytometry after 14 weeks of different feeding regimens. LFD, low-fat diet *ad libitum*; HFD, high-fat diet *ad libitum*; HFD-TRF, 8 weeks of time-restricted feeding after 6 weeks of high-fat diet *ad libitum*. Data are presented as mean ± SEM (n = 7). [a,b] Different superscipts indicate significant difference at least at $p < 0.05$ by ANOVA with Tukey's *post hoc* test.
