OR: odds ratio; CI: confidence interval; BMI: body mass index; HOMA: homeostatic model assessment for insulin resistance (IR) and peripheral insulin sensitivity (S).

Supplementary Figure 1

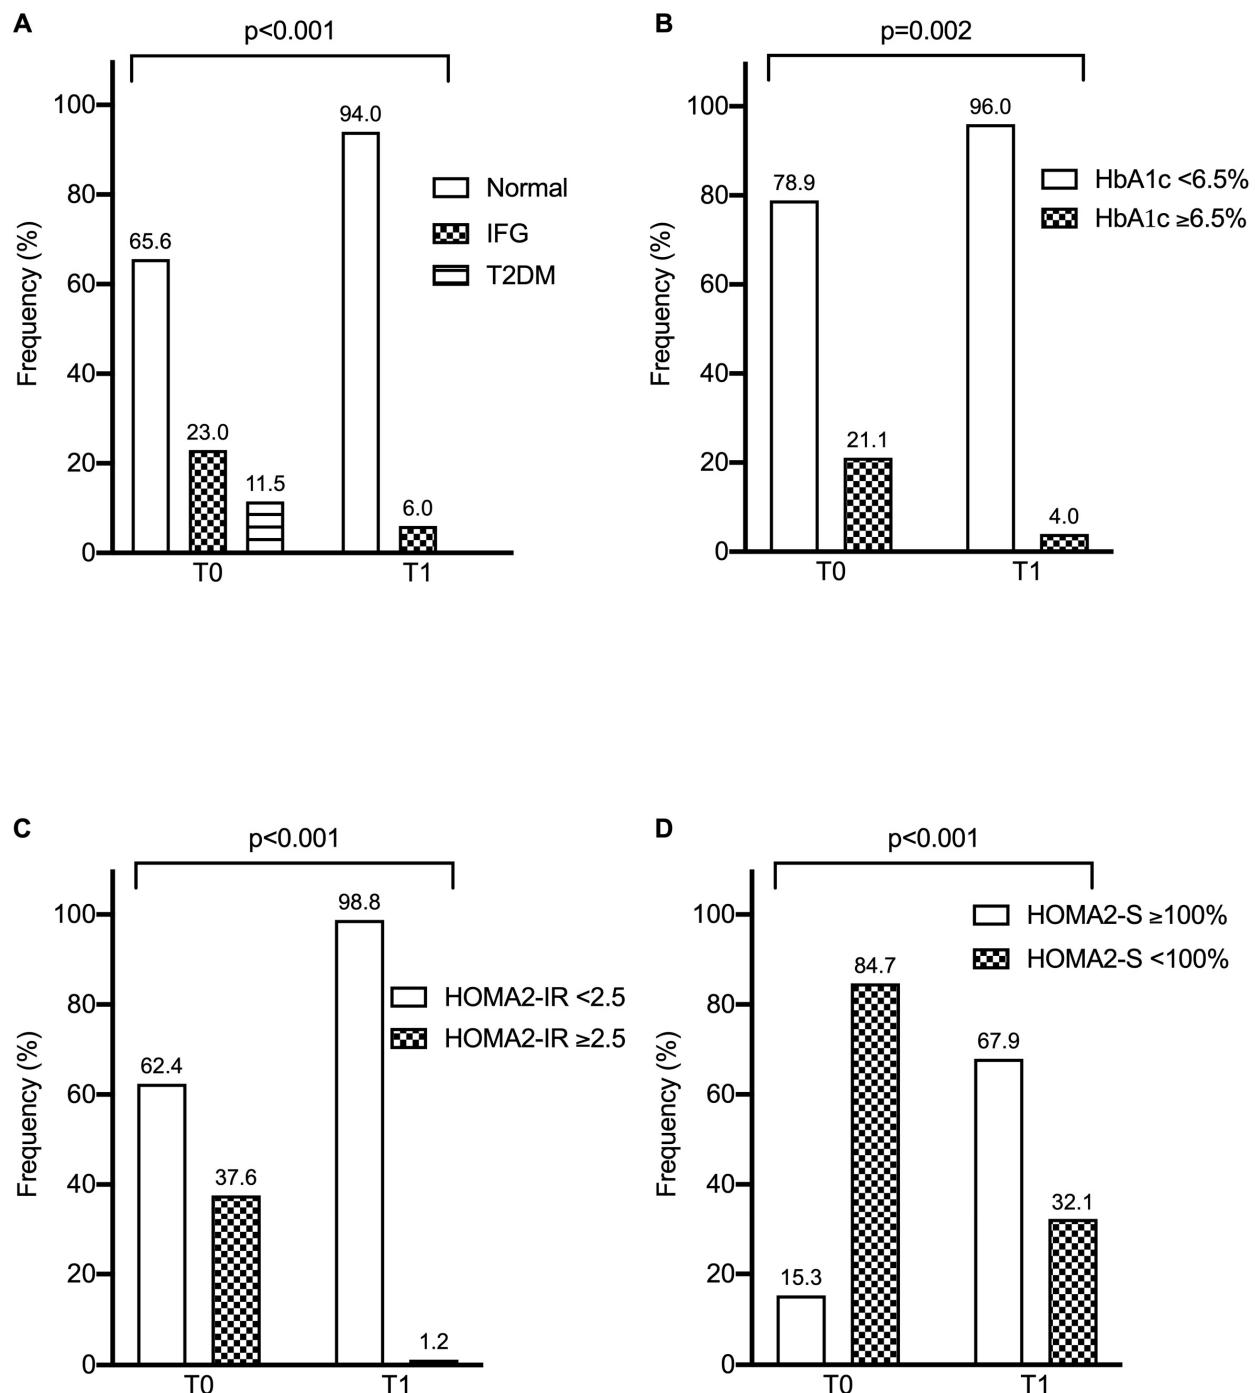

Figure S1. Sleeve gastrectomy significantly improves glycemic profile. Sleeve gastrectomy determine a general improvement of glycemic profile with regression of type 2 diabetes mellitus (T2DM) e reduction of patients with impaired fasting glucose (IFG) (A). Accordingly, there was an improvement of serum levels of glycated hemoglobin (B), and homeostatic model assessment (HOMA) for insulin resistance (IR) (C) and peripheral insulin sensitivity (%S) (D).
