IL-10	0.21 ± 0.21	<LOD	<LOD	0.35 ± 0.28	7.24 ± 2.46

Values are means (pg/mL) ± standard errors; chow-fed mice data are provided for reference purposes only and were not included in any statistical analyses.

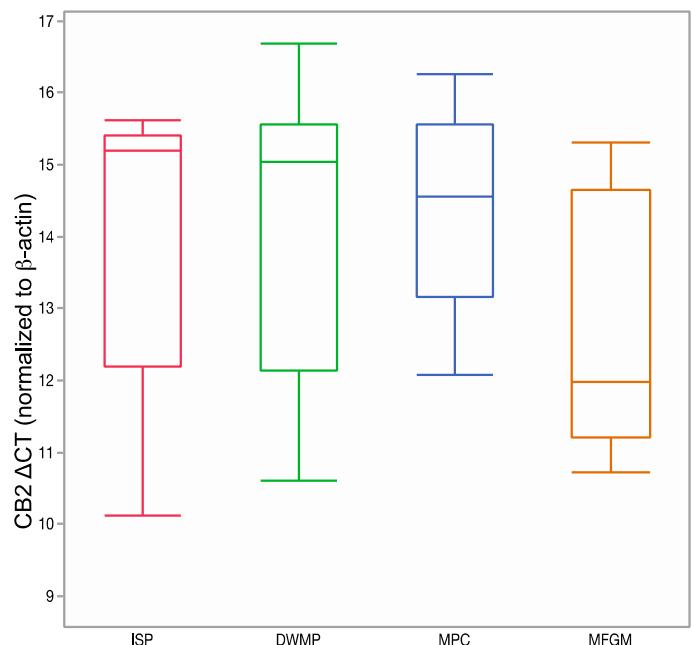

Supplementary Figure 1. Normalized C_T (ΔC_T) values for small intestine inflammatory gene expression

Normalized gene expression values (ΔC_T) are shown for those genes that reached significance of p-value <0.05 ANOVA and Tukey's HSD post-hoc analysis.

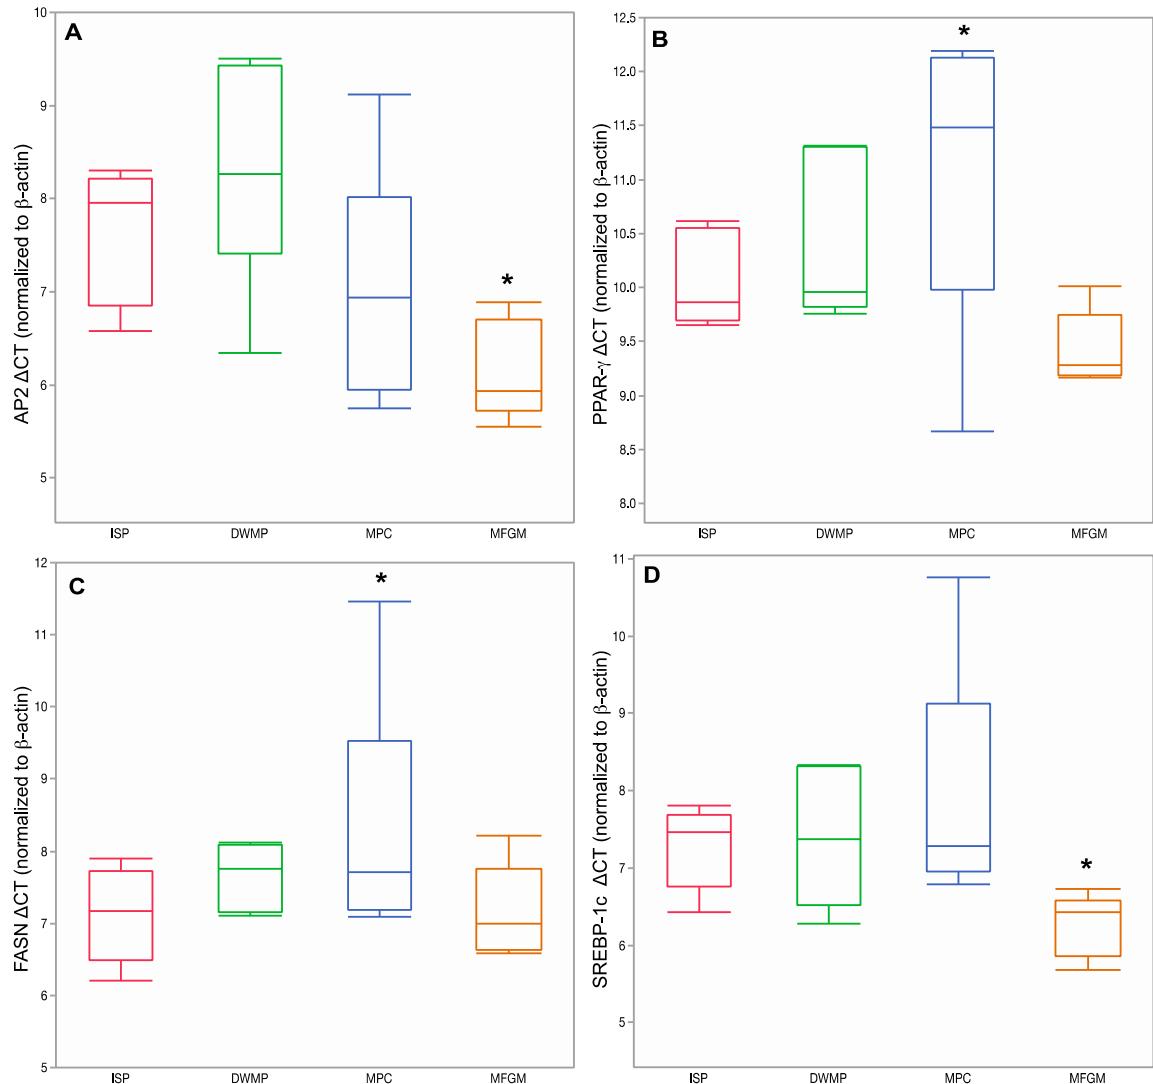

Panel A: $TLR4 \Delta C_T$ was significantly reduced in MFGM compared to the other diets ($p = 0.0285$). Panel B: $MyD88 \Delta C_T$ was highest in MPC and MFGM, nearing statistical significance ($p = 0.0591$). Panel C: $TNF\alpha \Delta C_T$ was highest in MPC ($p = 0.0017$). Panel D: ZO-1 did not show a difference statistically in ΔC_T ($p = 0.308$).

Supplementary Figure 2. Normalized C_T (ΔC_T) values for small intestine cannabinoid gene expression

Normalized gene expression values (ΔC_T) are shown for those genes that reached significance by fold-change of greater than 2.0 or less than 0.5 as defined in methods. CB2 did not show statistical differences for ΔC_T values ($p = 0.527$), but fold change of MFGM relative to ISP were greater than 2-fold.

Supplementary Figure 3. Normalized C_T (ΔC_T) values for small intestine adipocyte differentiation and lipogenesis gene expression

Normalized gene expression values (ΔC_T) are shown for those genes that reached significance by fold-change of greater than 2.0 or less than 0.5 as defined in methods. P-values from ANOVA and Tukey's HSD post-hoc analysis are provided.

Panel A: *AP2* was reduced in MFGM compared the other diets ($p = 0.0208$). Panel B: *PPAR-γ* was reduced in MFGM compared to DWMP ($p = 0.039$). Panel C: *FASN* did not show a difference statistically in ΔC_T ($p = 0.179$). Panel D: *SREBP-1c* did not show a difference statistically in ΔC_T ($p = 0.076$).
