

Supplementary Figure S1: ICSI does not alter mRNA expression levels of major placental transporter systems. Placental mRNA relative expression of the neutral amino acids transporters, *SLC38A1* (encoding SNAT1), *SLC38A2* (SNAT2) and *SLC38A4* (SNAT 4); of the glucose transporters, *SLC2A1* (GLUT1) and *SLC2A3* (GLUT3) and of the MDR efflux transporters, *ABCB1* (P-gp) and *ABCG2* (BCRP) in naturally conceived (n=10) compared to ICSI (n=9). Data are presented as media \pm SD. Groups were analyzed using Unpaired T-test.

Supplementary Figure S2: Free amino acids in circulation of mothers who conceived naturally (CON) or with ICSI. Many mothers, irrespective of conception group, had levels of free amino acids below the reference range. There were more CON mothers with amino acid levels within the reference ranges than ICSI mothers. Data are amino acid levels categorized based on national reference data (see parentheses). Each column represents the nutrient profile of an individual pregnancy. Refer to supplementary tables S1 and S2 for values.

Supplementary Figure S3: Free fatty acid and lipids in circulation of mothers who conceived naturally (CON) or with ICSI. Many mothers, irrespective of conception group, had undesirable levels of lipid biomarkers. All mothers had desirable HDL levels. Data are mean biomarker levels and categorized based on national reference data (see parentheses). Refer to supplementary tables S1 and S2 for values. FFA = free fatty acids. TG = triglycerides. Chol = cholesterol. LDL = low density lipoprotein. HDL = high density lipoprotein. VLDL = very low density lipoprotein.

Supplementary Table S1: Nutrient concentrations in maternal circulation with natural conception and ICSI.
