

Figure S1. Apoptotic and necrotic cells were not immediately observed after H₂O₂ exposure. BJ cells were incubated with eriodictyol (5 - 20 μM; 24 h), then exposed to H₂O₂ (500 μM, 1 h). The mode of cell death was instantly investigated after H₂O₂ challenge using Hoechst 33342/PI double-staining approach ($n = 3$; magnification = 20x; scale bar = 100 μm).

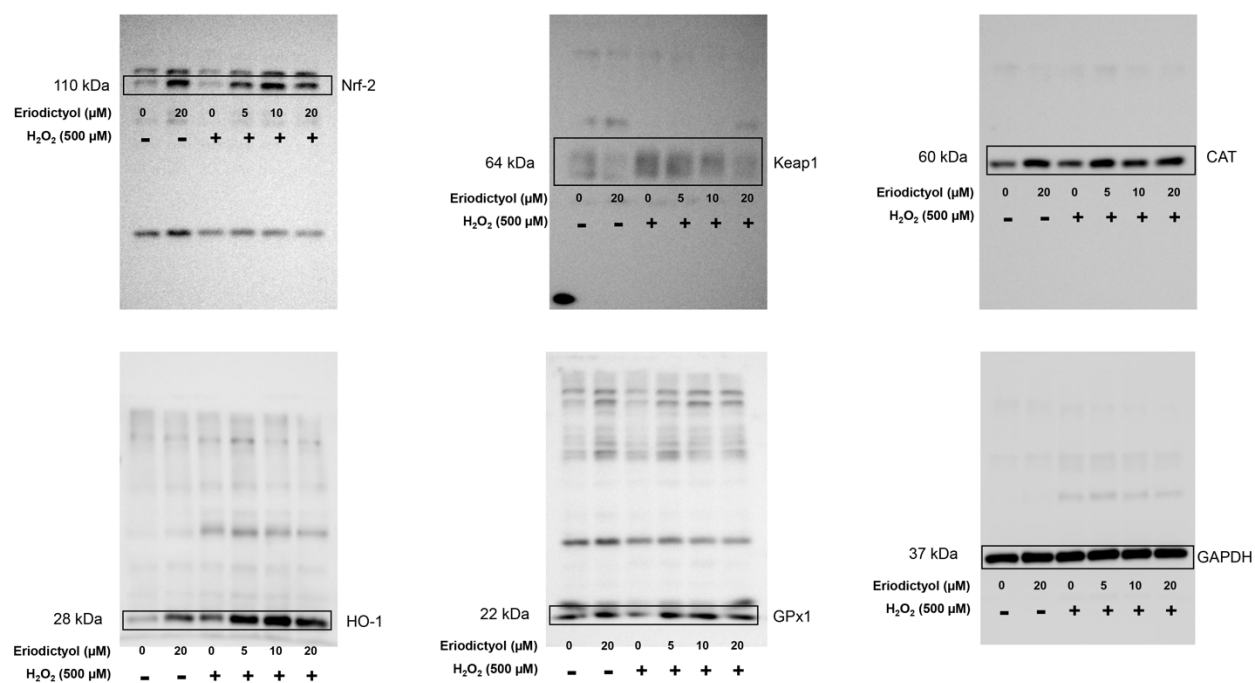

Figure S2. Full unedited western blots for Nrf2 (110 kDa), Keap1 (64 kDa), CAT (60 kDa), HO-1 (28 kDa), GPx1 (22 kDa) and GAPDH (37 kDa). These western blot images represent three biological replicates and are used to prepare Figure 7.
