<sup>1</sup>The VitD level is based on the measurement of the first trimester.

<sup>2</sup> Continuous variables were compared by using One-way ANOVA test for normal distribution data or Kruskal-Wallis rank sum test for skew distribution data among the 4 subgroups.

<sup>3</sup>Values are present as median (IQR).

<sup>1</sup>Values are n (%) for categorical variables and median (IQR) for a continuous variable with a skewed distribution. Vitamin D concentration was measured with 25-hydroxyvitamin D in the serum.

<sup>2</sup>Continuous variables were compared by using One-way ANOVA test for normal distribution data or Kruskal-Wallis rank sum test for skew distribution data among the 4 subgroups.

**Baseline inclusion criteria :**

- 1) singleton pregnancy;
- 2) maternal age between 18- 49 years-old;
- 3) the initial thyroid function test was performed in the first trimester;
- 4) without assisted reproduction;
- 5) without heart disease, hypertension, diabetes mellitus, kidney disease and autoimmunity disease before pregnancy;
- 6) without family or personal history of thyroid disease;
- 7) the first pregnancy information was remained if more than once pregnancy were detected for the same woman;
- 8) verified last menstrual period between 28th-Oct-2015-----29th-May-2019.
