

Supplementary Materials

Supplemental Methods. The definition of MetS based on the criteria of International Diabetes Federation (IDF)

Figure S1. Study flowchart of participant selection in three subcohorts

Figure S2. The time line of the study

Figure S3. Longitudinal dose-response relationship between baseline daytime napping duration and the remission of MetS

Table S1. Baseline characteristics of 5041 participants according to daytime napping duration in the subcohort 1

Table S2. Baseline characteristics of 2898 participants according to daytime napping duration in the subcohort 2

Table S3. Baseline characteristics of 11390 participants according to metabolic syndrome status in the subcohort 3

Table S4. Longitudinal associations of baseline daytime napping duration with the occurrence of MetS components

Table S5. Longitudinal associations of baseline daytime napping duration with the remission of MetS components

Table S6. Longitudinal associations of baseline daytime napping duration with the occurrence and remission of MetS after further adjusting for physical activity and multiple drug therapy

Table S7. Longitudinal associations of baseline daytime napping duration with the occurrence and remission of MetS according to inverse probability of treatment weighting

Table S8. Longitudinal associations of baseline daytime napping duration with the occurrence and remission of MetS after changing the diagnostic criteria of MetS

Table S9. Association of daytime napping duration with MetS severity score according to ordinal logistic regression

Table S10. Longitudinal associations of baseline daytime napping duration with the occurrence and remission of MetS in subgroups by depression, age and gender

Table S11. Longitudinal associations of baseline metabolic syndrome status and its components with follow-up daytime napping duration after further adjusting for physical activity and multiple drug therapy

Table S12. Longitudinal associations of baseline metabolic syndrome status and its components with follow-up daytime napping duration after using the secondary outcomes

Table S13. Longitudinal associations of baseline metabolic syndrome status and its components with follow-up daytime napping duration in subgroup analyses

Table S14. Cross-lagged regression coefficient of daytime napping duration with MetS severity score

Supplemental Methods. The definition of MetS based on the criteria of International Diabetes Federation (IDF)

According to this definition³³, for a person to be defined as having the MetS, they must have central obesity (waist circumference ≥ 90 cm for men and ≥ 85 cm for women) plus any two or more of four additional factors. These four factors are: (1) systolic blood pressure ≥ 130 mmHg or diastolic blood pressure ≥ 85 mmHg or self-reported hypertension or using antihypertensive drugs; (2) fasting plasma glucose (FPG) ≥ 5.6 mmol/L or self-reported diabetes or the use of diabetes medication.; (3) reduced plasma HDL-C (< 1.0 mmol/L for men and < 1.3 mmol/L for women) or specific treatment for this lipid abnormality; and (4) elevated plasma TG (≥ 1.7 mmol/L) or specific treatment for this lipid abnormality.

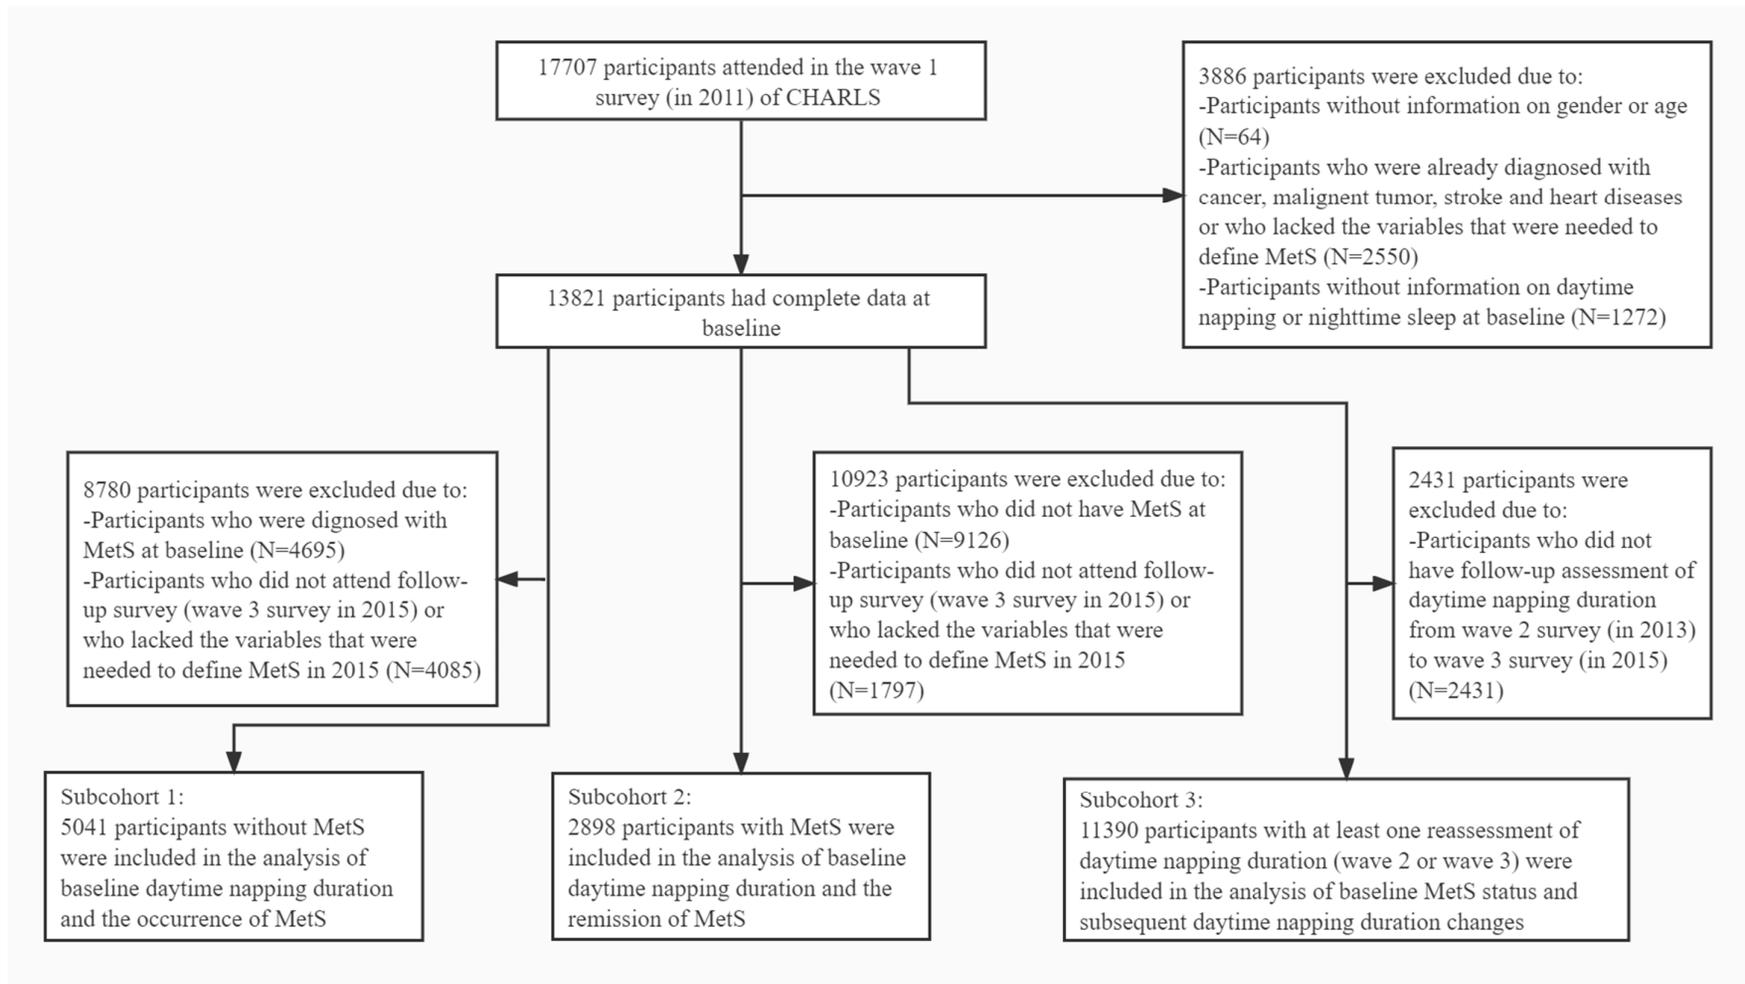

Figure S1. Study flowchart of participant selection in three subcohorts.

Abbreviations: MetS, metabolic syndrome; CHARLS, China Health and Retirement Longitudinal Study.

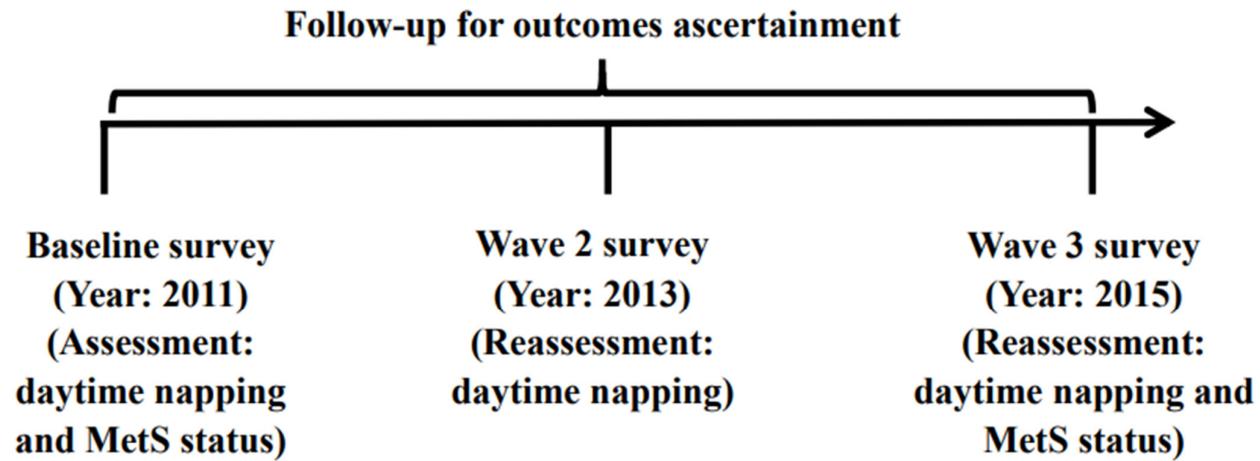

Figure S2. The time line of the study
Abbreviations: MetS, metabolic syndrome

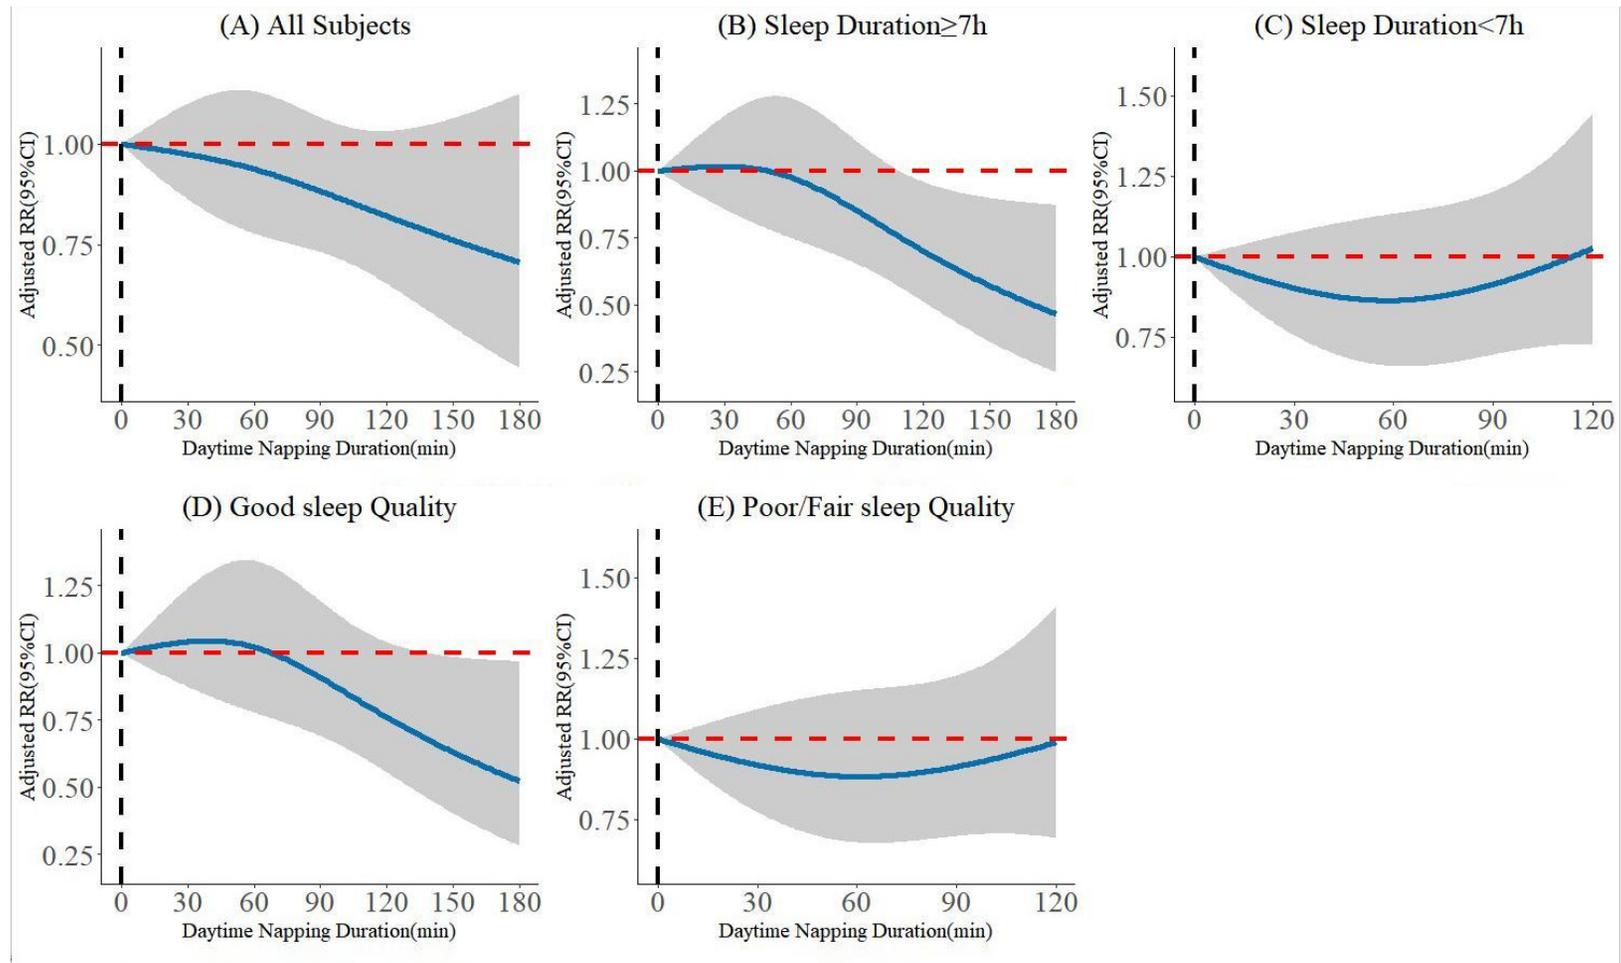

Figure S3. Longitudinal dose-response relationship between baseline daytime napping duration and the remission of MetS
 The curve was estimated by restricted cubic spline function with four knots. Solid lines indicate aRR. The reference was set to 0 min. The shadow represents

95% confidence intervals.

Table S1. Baseline characteristics of 5041 participants according to daytime napping duration in the subcohort 1

Characteristics	Daytime napping duration				<i>P</i> value
	0 minute/day	≤30 minutes/day	30–90 minutes/day	>90 minutes/day	
No. of participants	2515	458	1405	663	
Age (years), mean (SD)	57.70 (8.89)	56.67 (8.73)	58.32 (9.33)	58.58 (9.69)	0.001
Male, n (%)	1185 (47.1)	212 (46.3)	905 (64.4)	409 (61.7)	<0.001

extended nappers ^a	335	27 (8.1)	0.704 (0.469, 1.055)	0.089

Abbreviations: CI, confidence interval; aRR, adjusted relative risk; MetS, metabolic syndrome; LDL-C, low-density lipoprotein cholesterol; hsCRP, high sensitivity C-reactive protein; HDL-C, high-density lipoprotein cholesterol.

^aDaytime napping duration of non-nappers:0 minutes/day; Daytime napping duration of short nappers:>0 minutes/day to ≤30 minutes/day; Daytime napping duration of moderate nappers:>30 minutes/day to ≤90 minutes/day; Daytime napping duration of extended nappers:>90minutes/day.

Adjusted for: age, gender, living residence, marital status, educational level, smoking status, drinking status, depressive symptoms, nighttime sleep quality, nighttime sleep duration, serum uric acid, LDL-C , hsCRP and other MetS components.

Table S6. Longitudinal associations of baseline daytime napping duration with the occurrence and remission of MetS after further adjusting for physical activity and multiple drug therapy

Abbreviations: MetS, metabolic syndrome; LDL-C, low-density lipoprotein cholesterol; hsCRP, high sensitivity C-reactive protein; HDL-C, high-density lipoprotein cholesterol.

Adjusted for: age, gender, living residence, marital status, educational level, smoking status, drinking status, depressive symptoms, nighttime sleep quality, nighttime sleep duration, serum uric acid, LDL-C, hsCRP and napping duration at baseline in 2011.

Table S14: Cross-lagged regression coefficient of daytime napping duration with MetS severity score

Paths	β	SE	<i>P</i> value	95% CI
Baseline daytime napping duration →Follow-up daytime napping duration	0.382	0.014	<0.001	0.355-0.409
Baseline MetS severity score →Follow-up daytime napping duration	0.037	0.013	0.004	0.011-0.060
Baseline daytime napping duration →Follow-up MetS severity score	0.025	0.011	0.026	0.003-0.047
Baseline MetS severity score →Follow-up MetS severity score	0.583	0.010	<0.001	0.564-0.602
Baseline daytime napping duration ~Baseline MetS severity score	0.092	0.014	<0.001	0.065-0.119
Follow-up daytime napping duration ~Follow-up MetS severity score	0.017	0.010	0.090	-0.003-0.037

→ refers to the lagged effects between variables; ~ refers the covariance between the variables at same time point.

Abbreviation: CI, confidence interval; MetS, metabolic syndrome; β , path coefficients (including cross-lagged path coefficients, synchronous correlations and tracking correlations); SE, stand error.

adjusted for: age, gender, living residence, marital status, educational level, smoking status, drinking status, depressive symptoms, nighttime sleep quality, nighttime sleep duration, serum uric acid, LDL-C and hsCRP.
