Relative abundances less than 1 % were expressed as ETC. Wilcoxon rank-sum test was used to analyze the significance between the groups (*, $p < 0.05$; **, $p < 0.01$). Pre refers to the iron deficiency anemia (IDA) patient group, and Post refers to the group receiving iron supplementation and recovering from IDA. The superscripted a, b, and c denote the groups subjected to significance determination (a, Normal-Pre; b, Pre-Post; c, Normal-Post).
