

Supplementary Materials: Development and Evaluation of an Immuno-MALDI-TOF Mass Spectrometry Approach for Quantification of the Abrin Toxin in Complex Food Matrices

Sandrine Livet, Sylvia Worbs, Hervé Volland, Stéphanie Simon, Martin B Dorner, François Fenaille, Brigitte G Dorner and François Becher

Figure S1. MALDI-TOF spectra of abrin at 250 ng/mL in buffer after immunocapture with on-beads digestion conditions.

Figure S2. Optimization of abrin elution conditions. The red box indicates the signal of peptide GVQESVQDTFPNQVTLT-NIR. Optimization of elution conditions included elution time (10 or 30 min) or addition of acetonitrile in the elution solvent. Blank sample (A), elution with 90/10 H₂O/ACN containing 0.1% TFA, in 10 min (B), elution with 90/10 H₂O/ACN containing 0.1% TFA, in 30 min (C), elution with 50/50 H₂O/ACN containing 0.1% TFA, in 10 min (D). Final condition: 30 min elution in 90/10 H₂O/ACN containing 0.1% TFA.
