

Supplementary Materials: Combined Developmental Toxicity of the Pesticides Difenoconazole and Dimethomorph on Embryonic Zebrafish

Ruiqi Fan, Wanjun Zhang, Li Jia, Lizhong Li, Jun Zhao, Zengming Zhao, Shuangqing Peng, Yiqiang Chen and Xiaoyan Yuan

1. mRNA Library Construction

Firstly, RIN (RNA integrity number) and concentration were assessed using Fragment Analyzer 5400 (Agilent, USA), the RIN number should be over 8. Oligo(dT)-attached magnetic beads were then used to purify mRNA. The upcoming step was to generate the first-strand cDNA, which through a random hexamer-primed reverse transcription. Second-strand cDNA synthesis came next. The final library was formatted by single-strand circle DNA (ssCir DNA). The final library was amplified with phi29 to make DNA nanoballs (DNB), with more than 300 copies of one molecular. DNBS were loaded into the patterned nanoarray, and single-end 50 bases reads were generated on the BGISEq500 platform (BGI-Shenzhen, China).

2. RNA-Seq Data Analyze

The filter of the sequencing data was with SOAPnuke [1]. We define reads that contain more than 20% of quality \leq 5-base as low-quality reads and define reads whose unknown base ('N' base) ratio is more than 5% as unknown reads. Then, low-quality and unknown reads were removed. Details of filtered reads can be found in Supplementary Table 3. The remained clean reads were obtained and stored in FASTQ format. According to the official documents, we used HISAT2 (v2.0.4) to map the clean reads to the reference genome [2]. The reference database was provided by NCBI (GRCz11). The total mapping percentage ranged from 87.13% to 91.05%. Bowtie2 (v2.2.5) was applied to align the clean reads to the reference coding gene set [3], and the mapping percentage ranged from 64.30%–77.66%. RSEM (v1.2.12) was used to calculate the expression level of genes [4]. DESeq2(v1.4.5) was then used to analyze the differential expression levels [5]. The selected genes were transferred to Gene ID and then compared to the GO (<http://www.geneontology.org/>, accessed on 13 October 2020) and KEGG (<https://www.kegg.jp/>, accessed on 13 October 2020) database, then performed the enrichment analysis of annotated different expressed genes, results contained gene numbers and enrichment factor (See Supplementary Table 4 and 5). The significant terms and pathways were corrected by Q value with a rigorous threshold (Q value \leq 0.05) [6]. The heatmap and GO network were completed through Hiplot (<https://hiplot.com.cn/>, accessed on 13 October 2020).

SUPPLEMENTARY TABLES

Supplementary Table S1: Primer pairs of selected genes in qRT-PCR analysis

Gene	Forward Primer	Reverse Primer
β -actin	TCAGTGCACGCTGAGAAGAT	ATGCCAACCATCACTCCCTGA
<i>mcm2</i>	TTCGATCACTCAGGCAACTCC	GATGCGCTGGTAGTTCTGGT
<i>mcm3</i>	CTCAAGACACACCACGACCA	CCGGAGACTGAATCTGTGGA
